Preface

This book teaches Gujarati one word at a time, and it teaches each word by taking it apart. It is written for someone starting from zero — who may not read a single Gujarati letter — so the script is taught *inside the word lessons themselves*: each word introduces exactly the letters it needs, so you learn to read નમસ્તે *and* learn what it means in the same few minutes. (A reader who already reads Gujarati simply skims the “letters in this word” notes.)

Gujarati (*gujarātī*) is an **Indo-Aryan** language — a granddaughter of Sanskrit, like Hindi, Marathi, Punjabi, and Bengali — and the mother tongue of some sixty million people in Gujarat and across a famous global diaspora. It is the language of **Mahatma Gandhi**, who wrote his autobiography in it. Its script is Devanagari’s sister with one visible difference: it dropped the horizontal *top line*, so its letters float free — “the headless script.” Two threads run through the book: Gujarati’s Sanskrit inheritance (shared with Hindi), and the deep **Perso-Arabic** layer it took on as one of India’s great trading tongues (so “I’m well” is answered with the Persian *majā*, “relish”). Roots are traced to Sanskrit, to Persian/Arabic, and, where they reach, to the wider family that also gave English its words — every form supplied in full.

How to use this book

Every numbered section is one word, or one small phrase, and takes a few minutes — the length of a queue, an errand, or the walk to the bus. Read them in order the first time through: each section stands on the ones before it, and nothing is used before it has been taught. After that the book becomes reference, and you can open it anywhere.

Say the Gujarati out loud wherever you can. The prompts under *Your turn* are written to be spoken, and saying a word is most of what makes it stay. The questions under *Before you move on* carry their own answers in

brackets: cover them, answer from memory, then look.

Nothing here is gated behind the alphabet. Each lesson introduces exactly the letters and sounds its own word needs, so you are reading real words from the first page rather than drilling a chart. The whole script is gathered in a reference at the back of the book — somewhere to look things up when you are curious, never a chapter to sit through first.

Released under CC BY-SA 4.0 — share it, adapt it, teach from it.

The Gujarati script (reference)	67

Chapter 1

Greetings

The Gujarati greetings — and, taught through them, how to read a script that is Devanagari’s sister, but bareheaded. Each lesson introduces the letters its word needs.

1.1 નમસ્તે (*namaste*) — “hello,” and a script with no ceiling

The letters in this word

(If you already read Gujarati, skim this.) Gujarati runs **left to right**; every consonant carries a built-in “a”: ન na, મા ma, સા sa, ત ta. A *virama* joins consonants: સ + ર્ + ત → સ્ત. Above all: Gujarati has **no top line**. Devanagari, Bengali, and Gurmukhi hang letters from a bar (the *shirorekhā*); Gujarati cut it away — “the headless script.”

The word, taken apart — its roots and family

નમસ્તે (*namaste*) is Sanskrit *namas* (“a bow”) + *te* (“to you”) — “I bow to you,” the very word Hindi and Sanskrit use. Gujarati is **Indo-Aryan**, a granddaughter of Sanskrit, so it inherited the greeting whole. (The everyday Hindu hello is often કેમ છો? *kem chho?*, “how are you?” — Chapter 3.)

1.2 આભાર (*ābhār*) — “thank you,” an obligation gladly owed

The word, taken apart — its roots and family

આભાર (*ābhār*, “thanks”) is from Sanskrit *ābhāra* (“a burden, an obligation”), *ā-* (“toward”) + the root *bhr̥* (“to bear, carry”). To thank is to acknowledge you now *bear an obligation* — the idea behind English **oblige** and Portuguese *obrigado*. That root *bhr̥* is PIE **b^her-*, the ancestor of English **bear** (to carry) and Latin *ferre*.

1.3 હા / ના (*hā / nā*) — “yes” and “no”

The word, taken apart — its roots and family

હા (*hā*, “yes”) and ના (*nā*, “no”). The “no” rides the ancient negative *na-* — the same PIE **ne* behind English **no**, **not**, **none**, Latin *nōn*, Hindi *nahī̃*. One syllable spoken, in some form, from Iceland to Gujarat for five thousand years.

1.4 સારું (*sārũ*) — “good,” “okay”

The word, taken apart — its roots and family

સારું (*sārũ*, “good, fine, okay”) is from Sanskrit *sāra* (“essence, the best part”) — the same *sāra* behind Bengali’s *sāramilla*. As “okay/agreed” it oils every conversation.

Grammar Lens

Three genders, on the adjective. That -સારું (-*ũ*) ending is **neuter**. Gujarati, like Marathi, keeps three genders (Hindi kept two): *sāro* (m.) / *sārī* (f.) / *sārũ* (n.). Standing alone, “okay” is the neuter *sārũ*.

1.5 આવજો (*āvjo*) — “goodbye” (come again)

The word, taken apart — its roots and family

આવજો (*āvjo*) is the polite imperative of આવવું (*āvṽṽ*, “to come”) — literally “[please] come [again].” A Gujarati never signs off with “I’m leaving”; the parting word is *come*. It is the subcontinent’s “promise of return” (Tamil *pōy varugirēṇ*, Bengali *āshi*, Hindi *phir milenge*), here made a single warm word on the verb *to come*. (Familiarly: આવજે *āvje*.)

1.6 Recap

Gujarati		Meaning
નમસ્તે	<i>namaste</i>	hello / goodbye
આભાર	<i>ābhār</i>	thank you
હા / ના	<i>hā / nā</i>	yes / no
સારું	<i>sārũ</i>	good / okay
આવજો	<i>āvjo</i>	goodbye (“come again”)

Two things set Gujarati apart already: the **missing top line** (the “headless” script) and its **three genders** (*sāro/sārī/sārũ*). Roots banked: *ābhār* (*bhr̥* “to bear,” cousin of English *bear*), *nā* (PIE **ne*, English *no*), *āvjo* (“come again,” from *āvṽṽ*). Next chapter: introducing yourself.

Chapter 2

Introducing Yourself

Now a first real exchange — giving your name, asking for someone else’s, and saying you’re glad to meet them:

મારું નામ મીરા છે. (*mārũ nām Mira chhe* — “My name is Mira.”)
તમારું નામ શું છે? (*tamārũ nām shũ chhe* — “What is your name?”)

2.1 નામ (*nām*) — “name,” a word older than Europe

The word, taken apart — its roots and family

નામ (*nām*) ← Sanskrit *nāman*, from PIE **h₃nómn*. — the same root as English **name**, Latin *nōmen* (→ **noun**), Greek *onoma*, Hindi *nām*. Cousins from before either language existed.

2.2 મારું (*mārũ*) — “my,” and gender again

The word, taken apart — its roots and family

મારું (*mārũ*, “my”) is on the first-person root *ma-* — the same behind English **me**, **my**, **mine**, Latin *meus*, Hindi *merā*.

Grammar Lens

“My” agrees in three genders. *nām* is neuter, so “my name” is *mārũ nām*. The set: *māro* (m.) / *mārī* (f.) / *mārũ* (n.). Every possessive picks its form from the noun’s gender.

2.3 ઇ (chhe) — “is,” a copula all Gujarati’s own

The word, taken apart — its roots and family

ઇ (chhe, “is”) is Gujarati’s **copula** — and, unusually, *not* Hindi’s *hai* or Sanskrit’s *asti*. It grew from an Old Gujarati form (*achhai*) along its own path, so it quickly marks a sentence as Gujarati. Its forms: *hũ chhũ* (I am), *tũ chhe* (you are), *te chhe* (is), *tame chho* (you are, resp.).

Grammar Lens

The verb goes last. Gujarati is subject–object–verb: “my name Arun *is*.” *Chhe* sits at the end.

2.4 મારું નામ...ઇ — “my name is...”

મારું (my) + નામ (name) + name + ઇ (is) = “my name is...” *Mārũ nām Arun chhe*. The verb comes last; *mārũ* is neuter to agree with *nām*.

2.5 તું / તમે (tũ / tame) — “you,” familiar and respectful

The word, taken apart — its roots and family

તું (tũ, familiar “you”) ← Sanskrit *tvam*, PIE *tū — the root of English archaic **thou**, Latin *tū*, French *tu*, Hindi *tū*. તમે (tame, respectful) is grammatically plural — courtesy-by-plural, like French *vous*; it takes the plural copula *chho*.

2.6 શું (shũ) — “what”

The word, taken apart — its roots and family

શું (shũ, “what”) descends, by a winding road, from the interrogative stem *ka-* (PIE *k^wo-) — the root behind English **what**, Latin *quis*, Hindi *kyā*. Most Gujarati questions still show the *k-* plainly (*kem* how, *kōṇ* who, *kyāṇ* where, *kyāre* when); “what” wore down to this *sh-* form — the odd cousin in a *k-* family.

2.7 તમારું નામ શું છે? — “what’s your name?”

તમારું (*tamārũ*, “your,” neuter to match *nām*) + નામ + શું (what) + છે (is) = “your name what is?” — verb last. The familiar “your” is *tārũ* (from *tũ*). Note *mārũ* / *tārũ* / *tamārũ* — “my / your / your (resp.),” all neuter before *nām*.

2.8 આનંદ (*ānand*) — “joy,” and “a joy to meet you”

The word, taken apart — its roots and family

The full phrase is તમને મળીને આનંદ થયો (*tamne maḷīne ānand thayo*) — “having met you, joy happened.” આનંદ (*ānand*, “joy, bliss”) is **Sanskrit** — *ā-* (“fully”) + *nand* (“to rejoice”) — the *ānanda* of *sat-cit-ānanda* and a common Gujarati name.

2.9 The whole exchange

Gujarati	English
મારું નામ મીરા છે.	My name is Mira.
તમારું નામ શું છે?	What’s your name?
મારું નામ અરુણ છે.	My name is Arun.
તમને મળીને આનંદ થયો.	Pleased to meet you.

Every atom traced: *nām* ($\rightarrow$ *name*), *mārũ* ($\rightarrow$ *my*), *shũ* ($\rightarrow$ *what*), *tũ* ($\rightarrow$ *thou*). And *chhe* — Gujarati’s own “is,” not Hindi’s *hai*. Next chapter: *tame kem chho?* (“how are you?”).

Chapter 3

How Are You?

For most Gujaratis this is the real everyday hello:

તમે કેમ છો? (*tame kem chho* — “How are you?”)
હું મજામાં છું, આભાર. (*hũ majāmāṃ chhũ, ābhār* — “I’m well, thank you.”)

3.1 કેમ (*kem*) — “how,” a proper k- question

The word, taken apart — its roots and family

કેમ (*kem*, “how”; also “why”) is from the interrogative stem *ka-*, PIE **k^wo-* — the root behind English **wh-** and Latin *qu-*. It heads the plain *k-* family Gujarati kept: *kem* (how), *kōṇ* (who), *kyāṇ* (where), *kyāre* (when). And કેમ છો? is, for most Gujaratis, the real everyday hello.

3.2 તમે કેમ છો? — “how are you?”

તમે (*tame*, respectful “you”) + કેમ (how) + છો (*chho*, “are”) — “you how are?”, verb last. *Chho* is the respectful/plural form of the copula *chhe* from Chapter 2. To a friend: તું કેમ છે? (*tũ kem chhe?*).

3.3 હું (*hũ*) — “I”

The word, taken apart — its roots and family

હું (*hũ*, “I”) descends from Sanskrit *aham* (through Old Gujarati *haũ*). That *aham* is PIE *h₁eg(H)om — the ancestor of Latin **ego** and English **I**. It takes the copula *chhũ* (“am”): *hũ ...chhũ*.

3.4 મજા (*majā*) — “enjoyment,” and how to answer

The word, taken apart — its roots and family

મજા (*majā*, “enjoyment, relish, fun”) is **not** Sanskrit — it is **Perso-Arabic**, from Persian *maza* (“taste, relish”). Gujaratis, a great trading people, wove thousands of Persian and Arabic words into their speech across centuries of commerce over the Arabian Sea — and even “how are you” is answered with one: હું મજામાં છું (*hũ majāmāṃ chhũ*), literally “I am *in enjoyment*.”

3.5 વાંધો નહીં (*vāndho nahīm*) — “no problem”

The word, taken apart — its roots and family

વાંધો નહીં literally “[there is] **no objection**” — *vāndho* (“objection, difficulty”) + નહીં (*nahīm*, “not”), the fuller form of Chapter 1’s *nā*. Both from the ancient *na-*, PIE *ne, behind English **no**, **not**.

3.6 The whole exchange

Gujarati	English
તમે કેમ છો?	How are you?
હું મજામાં છું, આભાર.	I’m well, thank you.
વાંધો નહીં.	No problem / you’re welcome.

Roots banked: *kem* (the *k*- questions), *hũ* (*aham* → Latin *ego*, English *I*),

majā (**Persian** *maza* — the trade-language layer), *nahīm* (PIE *ne, English *no*). Next chapter: the farewells.

Chapter 4

Farewells

Chapter 1 gave you the quick આવજો (*āvjo*, “come again”). Its explicit companion:

પાછા મળીશું! (*pāchhā maḷīshũ* — “We’ll meet again!”)

4.1 પાછા (*pāchhā*) — “again, back”

The word, taken apart — its roots and family

પાછા (*pāchhā*, “back, again”) is from Sanskrit *paścāt* (“behind, after-ward”). It carries the sense of *return*: *pāchhā āvvũ* (“to come back”). Add it to “we’ll meet” for the warm goodbye.

4.2 મળીશું (*maḷīshũ*) — “(we) will meet”

The word, taken apart — its roots and family

મળીશું (*maḷīshũ*, “we will meet”) is the future of મળવું (*maḷvũ*, “to meet”), from Sanskrit *mil-* (“to join”) — the same root as Hindi *milnā*. Note the retroflex ળ (*ḷ*): Gujarati keeps this extra letter, like Marathi and the Dravidian south, unlike Hindi.

Grammar Lens

The future is an ending. *maḷ-* + *-īshũ* (“we will”) → *maḷīshũ* — no helper like English “will.”

4.3 પાછા મળીશું — “we’ll meet again”

પાછા (again) + મળીશું (we will meet) = “**we’ll meet again**” — the explicit form of Chapter 1’s *āvjo*, the subcontinent’s “promise of return” (Hindi *phir milenge*, Bengali *āshi*).

4.4 કાલે મળીશું (*kāle maḷīshũ*) — “see you tomorrow”

The word, taken apart — its roots and family

કાલ (*kāl*) means **both “tomorrow” and “yesterday”** — the day on either side of today — from Sanskrit *kāla* (“time”), the root behind Hindi’s *kal* and Punjabi’s *akāl* (“timeless”). The tense tells which: *kāle maḷīshũ* (future → “tomorrow we’ll meet”).

4.5 The farewells

Gujarati	English
આવજો.	Goodbye. (“come again”)
પાછા મળીશું.	We’ll meet again.
કાલે મળીશું.	See you tomorrow.

Roots banked: *āvjo* (“come again,” from *āvvũ*), *maḷvũ* (“to meet,” Sanskrit *mil-*; the retroflex ળ), *kāl* (*kāla* “time,” cousin of Hindi *kal*, Punjabi *akāl*). Next chapter: the first real verbs — *hũ gujarātī bolũ chhũ*.

Chapter 5

The First Verbs

Until now, “to be.” Now verbs that *act* — and sentences that move:

હું ગુજરાતી બોલું છું. (*hũ gujarātī bolũ chhũ* — “I speak Gujarati.”)

5.1 બોલવું (*bolvũ*) — “to speak,” your first full verb

The word, taken apart — its roots and family

બોલવું (*bolvũ*, “to speak”) is a native Indo-Aryan verb (the same *bol-* as Hindi *bolnā*, Punjabi *bolṇā*). Its ending -વું (*-vũ*) is Gujarati’s infinitive: *bol-vũ* “to speak,” *maḷ-vũ* “to meet,” *āv-vũ* “to come.” Strip it for the stem (*bol-*).

Grammar Lens

Stem + person + copula. *hũ bolũ chhũ* (I speak), *tũ bole chhe* (you speak), *tame bolo chho* (you, resp.), *te bole chhe* (he/she speaks). The plain present is the same for a man or a woman — Gujarati saves its **three genders** for adjectives and the past, not the simple present.

5.2 હું ગુજરાતી બોલું છું — “I speak Gujarati”

હું (I) + ગુજરાતી (*gujarātī*, the object) + બોલું છું (speak) — “I Gujarati speak,” verb last. The name ગુજરાત (*Gujarāt*) comes from the **Gurjar**, a people who entered western India around the 6th–8th centuries and gave their name to the land (*Gurjara-deśa* → *Gujarāt*); *gujarātī* is “[the language] of Gujarat.”

5.3 રહેવું (*rahevũ*) — “to live, to stay”

The word, taken apart — its roots and family

રહેવું (*rahevũ*, “to live, remain, stay”), from Sanskrit *rah-* (“to remain,” the same as Hindi *rahnā*): *hũ Amdāvādmām rahũ chhũ* (“I live in Ahmedabad”).

Grammar Lens

“In” comes after the noun. અમદાવાદમાં (*Amdāvādmām*) = *Ahmedabad* + *-mām* (“in”), on the noun’s *end*. Gujarati uses **postpositions**, verb last.

5.4 કામ કરવું (*kām karvũ*) — “to work”

The word, taken apart — its roots and family

કરવું (*karvũ*, “to do, make”) is from Sanskrit *kr̥* (“to do”), PIE **k^wer-* — the root of Chapter 1’s family: *namaskār* (“the *making* of a bow”), *karma* (“a thing *done*”). And કામ (*kām*, “work”) is itself from Sanskrit *karma*. Gujarati builds compounds as **noun** + કરવું: કામ કરવું (*kām karvũ*, “work-do” = “to work”). So *hũ kām karũ chhũ* = “I work” — the twin of Hindi’s *kām karnā* and Bengali’s *kāj karā*.

5.5 Sentences about yourself

Gujarati	English
હું ગુજરાતી બોલું છું.	I speak Gujarati.
હું અમદાવાદમાં રહું છું.	I live in Ahmedabad.
હું કામ કરું છું.	I work.

Three verbs, one engine: a stem, a person-ending, the copula forms *chhũ*, *chhe*, and *chho* — the verb always last, “in” after its noun. Roots banked: *bolvũ* (native), *rahevũ* (*rah-* “remain”), *karvũ* (*kr̥* — root of *namaskār*, *karma*; *kām* “work” ← *karma*), and *gujarātī* (the *Gurjar* people). From here, Gujarati — the tongue of Gandhi — only opens further.

Chapter 6

Numbers One to Five

By the end of this chapter: I can count from one to five in headless Gujarati script and explain why બે starts with b where its neighbours start with d, and why ત્રણ has an r that Hindi tīn does not.

Take the two odd numerals apart: બે descends from the feminine/neuter dvé by dv → bb → b, while ત્રણ's r is a learned restoration from Sanskrit, put back after Prakrit tṛṇi had already dropped it.

6.1 એક, બે, ત્રણ, ચાર, પાંચ — one to five

Three of these will look familiar from any other Indian language. Two won't — and both have a reason.

You'll want to know: the five

	Gujarati	said
1	એક	ek
2	બે	be
3	ત્રણ	traṇ
4	ચાર	chār
5	પાંચ	pāch

Notice the script: Gujarati is Devanagari **without the top line**. Same letters, same system — the shirorekha simply isn't drawn. If you've done the Hindi writing track you can feel the relationship immediately.

What you’ve built: two surprises and a headless script

Most neighbouring languages have a *d* in “two,” but Gujarati says બે *be*. Hindi says *tīn* for “three,” but Gujarati says ત્રણ *traṇ*, with an *r*. Do not carry both histories while the count is still new. Make the five forms automatic first; the next prerequisite-ordered lesson explains why *be* and *traṇ* took those shapes.

Your turn

Say these aloud:

- “ek, be, traṇ, chār, pāch”
- the odd two — Gujarati **be** and **traṇ**
- the script clue — Devanagari shapes without a top line

Before you move on

Count to five in Gujarati. (*Ek, be, traṇ, chār, pāch.*) Why does બે look unlike its neighbours? (It begins with *b*, not *d*.) What does ત્રણ contain that Hindi *tīn* does not? (*r*.) What is visibly missing from the Gujarati script? (The top line: the *shirorekḥā* is not drawn.) Next: trace the two surprising number histories.

6.2 Two number histories: *be* and *traṇ*

Count once: *ek, be, traṇ, chār, pāch*. Which two forms look least like Hindi or Marathi? (*Be* and *traṇ*.)

The word, taken apart — its roots and family

Sanskrit had gendered forms of “two,” and its daughters selected different parts of that paradigm:

language	“two”	route
Sanskrit	<i>dváu</i> (masc.) · <i>dvé</i> (fem. and neut.)	—
Hindi	<i>do</i>	masculine side
Marathi	<i>don</i>	masculine side, plus an analogical <i>-n</i>
Bengali	<i>dui</i>	disyllabic Prakrit <i>duve</i>
Gujarati	<i>be</i>	feminine/neuter <i>dvé</i> side

Gujarati બે is not a corruption of *do*. It is a **different inheritance** from the same Sanskrit paradigm.

The initial cluster changed too. In *dv-*, the dental *d* adopted the **labial place** of the following *v*: *dv* → *bb* → *b*. The first consonant was remade in the shape of its neighbour, then the double simplified.

The word, taken apart — its roots and family

stage	“three”
Sanskrit neuter	<i>trīṇi</i>
Prakrit	<i>tiṇṇi</i> : <i>r</i> already gone
Hindi	<i>tīn</i>
Gujarati	<i>tran</i> : <i>r</i> present again

The shared **ṇ** shows that Hindi and Gujarati both descend from neuter *trīṇi* through Prakrit *tiṇṇi*. By that stage, the *r* was gone and its weight had moved into doubled *ṇṇ*. Hindi later simplified the double and lengthened the vowel.

Gujarati’s *tr-* is generally treated as **restored from Sanskrit**, not carried through unbroken. Sanskrit remained a literary language and continued to reshape its descendants. *Tran* looks older than *tīn*, but it is closer because speakers put the *r* back.

Your turn

Say these aloud:

- Gujarati’s selected form — feminine/neuter *dvé*
- the sound path — *dv* → *bb* → *b*

- the r path — $trīṇi \rightarrow tiṇṇi \rightarrow traṇ$
- inherited continuously or restored — restored

Before you move on

Why *be*, not Hindi *do*? (Different Sanskrit forms.) What changed in $dv \rightarrow b$? (D became labial beside v ; the double simplified.) Did *traṇ* keep r ? (No: Sanskrit restored Prakrit's lost r .) How can a newer form look older? (Learned restoration.)

Chapter 7

Six Verbs at the Core

By the end of this chapter: I can name six everyday Gujarati verbs by the neuter -જ ending they all share, strip that ending to reach the stem, and say what I do with stem, person-ending, and the copula છે.

The sixth verb runs the whole chapter at once: strip the neuter -જ from all six infinitives, hold the retroflex ણ that Prakrit pulled back from a plain n, put the stem into hũ jāṇũ chhũ, and connect jāṇvũ to the English know it is genuinely cousin to.

7.1 છેજ — “to be,” and the neuter that names every Gujarati verb

You already end a Gujarati sentence with છે *chhe*, “is.” Here is the whole verb behind English “to be” — and the ending that names every other Gujarati verb.

You’ll want to know first — one word

છેજ — *hovũ* — **to be**

Left to right: છે is *ha*, and the sign ે on it makes *ho*; then વ *va*, with the small ુ under it for *vu*; and the dot ˙ on top sends that last vowel through the nose.

Take the final piece -જ *-vũ* off, and the **stem** is left: છે- *ho-*.

Grammar Lens: the ending is a neuter

Gujarati sorts words into **three** genders where Hindi next door keeps two: masculine **-o**, feminine **-ī**, and the third one, **neuter**, **-ũ** — *sāro*, *sārī*, *sārũ*, three shapes of “good.”

That third gender is where **-જ** comes from. **-જ -vũ** is a neuter ending, so **every Gujarati verb is named in the neuter**. English names a verb by putting a word in front, “to be”; Gujarati names it by putting its third gender on the end — and hands you the stem for free every time.

The word, taken apart — its roots and family

hovũ comes from Sanskrit *bhavati*, “becomes,” on the root *bhū-*. Middle Indo-Aryan thinned that *bh-* to *h-*, so *bhavati* wore down to *hoi* and then to *hovũ*. The root is Indo-European, **bheu-* “grow, become,” and English is full of it: **be**, **been**, and — through “the place where one dwells” — **build**, **booth**, **bower**. Latin held it as *futūrus*, English’s **future**; Greek as *phúsis*, English’s **physics**.

But **છ** *chhe* is not from that root at all. It comes through Old Gujarati *achhai* from a Sanskrit verb of **dwelling**, **abiding** — staying put rather than becoming — and its cousins are Bengali *āche* and Marathi *āhe*. Hindi’s *hai* continues Sanskrit *asti* “is,” the same ancient verb as English **is**.

So English **is** and Hindi *hai* are relatives; Gujarati **chhe** is not one of them. English plays the same trick, running *be*, *am*, *is*, *was* off several old verbs at once.

Your turn

- *Say it*: **hovũ** — to be
- *Strip*: **hovũ** minus **-vũ** leaves the stem **ho-**
- *Name*: the gender of **-vũ** — neuter, the third one
- *Split*: **chhe** from a verb of dwelling; *hai* and English **is** from another

Before you move on

Which ending names a Gujarati verb, and which of the three genders is it? (**-vũ**, neuter.) What is left of *hovũ* once it comes off? (**Ho-**)

Does **chhe** share an ancestor with Hindi *hai*? (No — *hai* goes with English **is**; *chhe* comes from a verb of dwelling.)

Sources: Wiktionary: ૈ; Wiktionary: ે.

7.2 ૈ — “to go,” and a *y* that turned into a *j*

Name the ending that titles every Gujarati verb, and take it off *hovũ*. Here is the second verb wearing it.

You’ll want to know first — one word

ૈ — *javũ* — **to go**

Left to right: ૈ is *ja* — it carries a built-in *a*, because a Gujarati consonant with no vowel sign on it always does. Then the familiar ે -*vũ*. Two pieces, and you have met the second one already: ૈ + ે.

Strip the ending and the stem is ૈ- *ja-*, which stretches to ૈ- *jā-* the moment a person-ending follows it.

The word, taken apart — its roots and family

javũ continues Sanskrit *yāti*, “goes,” on the root *yā-*. The consonant changed on the way: **Prakrit turned word-initial Sanskrit *y-* into *j-*, right across the middle period.** That is a decoding tool worth keeping, because it runs through the whole vocabulary:

- Sanskrit *yoga* → Gujarati *jog*
- Sanskrit *yamunā* (the river) → *Jamnā*
- Sanskrit *yava* “barley” → *jav*
- Sanskrit *yuvan* “young” → *jovān* “a young man”

So a Gujarati word starting in *j-* often has a Sanskrit *y-* standing behind it.

This particular root left little in English — honest news, and better said than faked. Its clearest survival outside India is Sanskrit *yāna* “vehicle, journey,” the word inside **Mahayana**, “the great vehicle.”

Grammar Lens: stem, then person, then the copula

Gujarati builds its plain present out of three pieces in a fixed order — stem, an ending that says *who*, and the copula you already own:

- *hũ jāũ chhũ* — I go
- *tame jāo chho* — you go, respectfully
- *te jāy chhe* — he goes, she goes

The copula is the piece that shifts: *chhũ*, *chho*, *chhe*. It is **chhe** doing that work, not Hindi’s *hai* — the tell you traced last time. And a man and a woman say these identically: the plain present carries no gender at all.

Your turn

- *Say it:* **javũ** — to go
- *Strip:* **javũ** minus **-vũ** leaves **ja-**
- *Build:* **hũ jāũ chhũ** — I go
- *Trace it:* Sanskrit *yāti* → **javũ**, the *y-* becoming *j-*
- *Apply:* *yoga* → **jog**, *yava* → **jav**

Before you move on

What happened to Sanskrit *y-* at the front of a word? (Prakrit made it *j-*.) Which three pieces make the Gujarati present? (Stem, person-ending, copula.) Say “I go.” (*Hũ jāũ chhũ*.) Which of those three words is the copula, and which language does it *not* match? (*Chhũ*; Hindi.)

Source: Wiktionary: જાવું.

7.3 આવું — “to come,” which began as “to reach”

Say “I go” in Gujarati, then strip *javũ* to its stem. Here is the verb that points the other way.

You'll want to know first — one word

અવૃ — *āvvũ* — to come

It opens with અ, the standalone letter for long *ā* — Gujarati uses a full letter, not a sign, when a word begins with its vowel. Then વ *va*, a second વ, the ુ, and the nasal dot.

Two વ in a row, each belonging to a different piece: the first closes the stem અવ- *āv-*, the second opens the ending -વૃ *-vũ* you now know by heart.

The present runs as before: *hũ āvũ chhũ*, “I come.”

The word, taken apart — its roots and family

āvvũ comes through Old Gujarati *āvivaũ* and Prakrit *āvei* from Sanskrit *āpayati*, on the root **āp-**, “to reach, to attain.” Gujarati’s “come” is not built from “go” at all. It is built from **arriving** — reaching the place where the speaker already is.

That root is Indo-European, and Latin holds it as *apere*, “to fasten, to reach for.” English took the family whole: **apt** (“fitted”), **aptitude**, **adapt**, **adept**, **inept**. Put *co-* “together” in front and Latin makes *cōpula*, “the thing that fastens two things into one” — which English borrowed in two shapes: worn down into **couple**, and kept whole as the grammarian’s **copula**.

So the Gujarati verb for coming and the technical name for what **chhe** does at the end of your sentences are, far enough back, one root.

What you’ve built: the *p* that softened to a *v*

One regular change did most of the work between *āpayati* and *āvei*: **a single Sanskrit *p* standing between two vowels softened to *v***. It happened right across the vocabulary, so it decodes far more than this verb:

- Sanskrit *dīpa* “lamp” → *dīva* → Gujarati *divo*
- Sanskrit *kūpa* “well” → Gujarati *kūvo*

And *dīpa* is half of દિવાળી *divālī* — *dīpa* plus *āvalī*, “a row of lamps.” The festival carries the sound change in its own name.

Your turn

- Say it: **āvvũ** — to come

- *Split*: āv- plus -vũ, the two ૧ belonging to different pieces
- *Build*: hũ āvũ chhũ — I come
- *Trace it*: Sanskrit āp- “reach” → āvvũ, and → English apt, couple
- *Apply*: dīpa → divo, kūpa → kūvo

Before you move on

What did the root behind āvvũ originally mean? (“Reach, attain.”)
 What happens to a single Sanskrit *p* between vowels? (It softens to *v*.)
 Which English word for a joining verb is a cousin of āvvũ? (**Copula**.)
 Say “I come.” (Hũ āvũ chhũ.)
 Source: Wiktionary: ૨૧૧૧.

7.4 ૨૧૧૧ — “to eat,” and a family that stops before English

Say “to come,” then name the ending it shares with every other Gujarati verb. The fourth verb takes a new letter with it.

You’ll want to know first — one word

૨૧૧૧ — *khāvũ* — to eat

The new letter is ૨, *kha*: a *k* with a puff of breath straight after it. English makes that puff without noticing — hold a hand in front of your mouth and say *kite*. Gujarati notices, and gives the puffed and unpuffed sounds separate letters, ૨ and ૩.

Then the long-*ā* sign ં, and the ending you know: ૨૧- *khā*- plus -૧ -*vũ*. The present is *hũ khāvũ chhũ*, “I eat.”

The word, taken apart — its roots and family

khāvũ comes from Sanskrit *khādati*, “chews, eats.” Prakrit kept it as *khādi*, and then the single *d* between vowels wore away — the same erosion that has been thinning these verbs all along — leaving the bare stem *khā*.

Its sisters are all alive: Hindi *khānā*, Punjabi *khāṇā*, Marathi *khāṇe*, Bengali *khāoyā*. One verb, five modern shapes.

And there the family stops. Scholars reconstruct an Indo-European root behind *khādati*, but it left nothing in English — no cousin, no borrowing, not even a worn-down one. That is worth saying out loud rather than reaching for a lookalike, because this whole method rests on hanging a new word on a word you already own, and **a cousin that is not really a cousin is worse than none at all**. Some words you take on their own terms. *Khāvũ* is one of them, and its five sisters are anchor enough.

Your turn

- *Say it*: **khāvũ** — to eat, with the breath after the *k*
- *Contrast*: ॡ puffed, ॢ unpuffed
- *Build*: **hũ khāũ chhũ** — I eat
- *Trace it*: Sanskrit *khādati* → *khādi* → **khāvũ**, the *d* worn away
- *Admit*: no honest English cousin — and that is the right answer

Before you move on

What separates ॡ from ॢ? (A puff of breath.) Which Sanskrit verb is behind *khāvũ*, and what happened to its *d*? (*Khādati*; it wore away between the vowels.) Which English word is its cousin? (None — and pretending otherwise would be worse than admitting it.) Say “I eat.” (*Hũ khāũ chhũ*.)

Source: Wiktionary: ॡ३.

7.5 ॡ३ — “to see,” one mark away from “to go”

Two verbs back: how do you say “to go,” and how do you say “to eat”? The fifth verb is the nearest neighbour *javũ* has.

You’ll want to know first — one word

ॡ३ — *javũ* — to see

ॡ *ja*, wearing the sign ॢ that turns it into *jo*; then the ending ३ -*vũ*. The stem is ॡ- *jo*-, and the present runs as it always has: *hũ joũ chhũ*, “I see.”

What you’ve built: one mark apart

Set the two words side by side and the whole difference is one small mark:

- જણ *javũ* — to go. Bare જ, carrying its built-in *a*.
- જોણ *jovũ* — to see. The same જ, with ળ on it.

Add that one sign and going becomes seeing. In the mouth the contrast is just as small and just as total — *ja* against *jo* — so this is a pair worth saying aloud until the vowels separate cleanly. Gujarati will keep doing this: the consonants carry the word, and a single vowel mark decides which word it is.

The word, taken apart — its roots and family

jovũ continues a Prakrit verb *joai*, “looks.” Where *joai* itself came from is genuinely unsettled, and it is more useful to say so than to pick a winner.

The usual account takes it from Sanskrit *dyotate*, “shines” — sight arriving by way of light. That is a well-worn path: Greek *phainō* “shine” produced *phainómenon*, “a thing that shows itself,” which English borrowed as **phenomenon**, and from the same family **phantom** and **fantasy**. A second account brings in an older verb of watching and waiting for, the one behind Hindi *johnā*, “to watch out for.” The two may simply have run together; forms do that.

So: **probable, not proven**. Etymology has error bars like any other science, and a lesson that hides them is teaching you to trust the wrong things.

Your turn

- *Say it*: **jovũ** — to see
- *Contrast*: **javũ** go, **jovũ** see — one mark, one vowel
- *Build*: **hũ joũ chhũ** — I see
- *Hedge*: *jovũ* probably from “shines” — probable, not proven
- *Run through*: **hovũ, javũ, āvvũ, khāvũ, jovũ**

Before you move on

What single mark separates *javũ* from *javũ*? (The ્ sign: *ja* becomes *jo*.) Say “I see.” (*Hũ joũ chhũ*.) How settled is the origin of *javũ*? (Not settled — probably from a verb meaning “shines,” possibly merged with one meaning “watch out for.”)

Source: Wiktionary: જોવું.

7.6 જાણવું — “to know,” a word English has been carrying all along

Run the five you have — *hovũ*, *javũ*, *āvvũ*, *khāvũ*, *javũ* — and pull the ending off each one. The sixth is the closest of them all to English.

You’ll want to know first — one word

જાણવું — *jāṇvũ* — to know

જ *ja* with the long-*ā* sign ્ on it gives *jā*. Then a new letter: ્, an *n* made with the tongue tip curled back onto the roof of the mouth — a **retroflex**, written *ṇ*. Gujarati inherited a whole set of these curled sounds from Sanskrit, and you have met one before in ્ *ḷ*.

Then the ending. જાણ- *jāṇ-* plus -વું *-vũ*, and the present is *hũ jāṇũ chhũ*, “I know.”

The word, taken apart — its roots and family

jāṇvũ comes from Sanskrit *jānāti*, “knows,” on the root *jñā-*. The retroflex is Prakrit’s work: a single *n* between vowels was pulled back onto the roof of the mouth, so *jānāti* became *jāṇadi* and then *jāṇvũ*. The root is Indo-European, **gnō-* “to know,” and English is stuffed with it.

Straight down the Germanic line: **know**, **knowledge**, **can** — which once meant “to know how” — **cunning**, **ken**, and **uncouth**, literally “un-known.” Borrowed from Latin *(g)nōscere*: **notice**, **note**, **notion**, **cognition**, **recognize**, **acquaint**, **noble** (“well-known”), and **ignore**, which is “not to know.” Borrowed from Greek *gnōsis*: **diagnosis**, **prognosis**, **agnostic**.

Two verbs ago the family stopped before English entirely. This one runs

three dozen words deep. *Jāṇvũ* is not a stranger: it is a first cousin of the plainest word English owns for the same idea, and every one of those borrowings is another peg to hang it on.

Your turn

- *Say it:* **jāṇvũ** — to know, with the tongue curled back on the *ṇ*
- *Build:* **hũ jāṇũ chhũ** — I know
- *Run through:* all six — *hovũ, javũ, āvvũ, khāvũ, jovũ, jāṇvũ* — stripping each stem
- *Build:* **hũ jāũ chhũ, hũ āvũ chhũ, hũ khāvũ chhũ, hũ joũ chhũ**
- *Connect:* **jāṇvũ** ← *jñā-* → English **know, notice, diagnosis**

Before you move on

Name all six verbs and take the ending off each. (*Ho-*, *ja-*, *āv-*, *khā-*, *jo-*, *jāṇ-*; the ending is the neuter **-vũ**.) Which English verb is the same word as *jāṇvũ*? (**Know**.) What makes the ṇ different from a plain *n*? (The tongue curls back.) Say “I know.” (*Hũ jāṇũ chhũ*.)
Source: Wiktionary: **᩠᩵ᩅᩢᩣᨾᩮᩥᩬ᩵**.

Chapter 8

The Mind and the Page

By the end of this chapter: I can say that I think, understand, read and write in Gujarati, hear and write the nasal that sits in the middle of વાંચવું, and name what each of the four roots was doing before it meant a mental act — ranging about, waking up, speaking, and scratching.

Say હું મારું નામ લખું છું, run the chapter’s four verbs back with the four things their roots meant — *vichārvũ* from a root meaning to range about, *samajvũ* from one meaning to wake, *vāchvũ* from one meaning to speak, *lakhvũ* from one meaning to scratch — place the medial nasal of *vāch-* and the assimilate-then-simplify path from *dhy* to *j*, and say which of the four honestly has no English cousin at all.

8.1 વિચારવું — “to think,” which began as wandering

Jāṇvũ — take the ending off it, and name the plain English verb that is the same word. Knowing is where you arrive. Here is what you do on the way.

You’ll want to know first — one word

વિચારવું — *vichārvũ* — **to think**

The stem is વિચાર- *vichār-*: *hũ vichārũ chhũ*, “I think.”

The letters in this word

વિ is વ *va* wearing િ, the short-*i* sign — and that sign stands to the left of its letter although the sound comes after it. Then ચ: the letter ચ *cha*,

already yours from *chār*, “four,” under the long-*ā* sign. Then २ *ra*, and the ending ३.

The word, taken apart — its roots and family

વિચાર *vichār* is a word before it is a verb: it means **a thought**. It is Sanskrit *vicāra* — **vi-** “apart, thoroughly” on the root **car-**, “to move, to range about.” A thought is named as a **ranging over**, the mind walking round a thing.

The root is Indo-European, **kwel-* “to turn.” Germanic wore it into **wheel**, whose whole business is turning. Greek made *kúklos*, “a circle,” which English borrowed as **cycle** and **encyclopedia**. Latin made *colere*, “to till, to dwell in,” behind **cultivate**, **culture** and **colony**.

What you’ve built: a verb Gujarati made rather than inherited

Hovũ, *javũ*, *āvvũ*, *khāvũ*, *jovũ* and *jāṇvũ* came down the ordinary road, worn thinner at every step. *Vichārvũ* did not: Gujarati took the **noun** *vichār* and put a verb ending on it, on the model of Sanskrit *vicarati*.

You have watched Sanskrit reach forward like this before. Count to three: *ek*, *be*, *traṇ*. Prakrit had lost the *r* of *trīṇi*, and *traṇ* carries it because Sanskrit put it back. A language that never stops reading its ancestor never stops borrowing from it. *Traṇ* got a sound that way; *vichārvũ* got a whole verb.

Your turn

- *Say it*: **vichārvũ** — to think
- *Strip*: minus **-vũ** leaves **vichār-**, which is also the noun “a thought”
- *Build*: **hũ vichārũ chhũ** — I think
- *Trace it*: *vi-* plus *car-* “range about” → **wheel**, **cycle**, **colony**
- *Contrast*: **jāṇvũ** handed down, and English **know**; **vichārvũ** built — as *traṇ* had its *r* handed back

Before you move on

What did the root behind *vichār* mean first, and which everyday English word turns on it? (“To range about”; **wheel**.) Was *vichārvũ* handed down or built, and which count of yours was patched the

same way? (Built on the noun *vichār*; *traṇ* had its *r* restored.) Say
 “I think.” (*Hũ vichārũ chhũ.*)
 Source: Wiktionary: *वियारवुं*.

8.2 સમજવું — “to understand,” which is waking up

Two verbs and one root meaning: *jāṇvũ*, and *vichārvũ* on a root that meant **to range about**. The third sits between them, with a third kind of picture again.

You’ll want to know first — one word

સમજવું — *samajvũ* — **to understand**

The stem is સમજ- *samaj*:- *hũ samajũ chhũ*, “I understand.” *Samaj* on its own, said alone, means “understood.”

The letters in this word

Not one new letter. સ *sa* stood in *namaste*, મા *ma* in every *mārũ*, જ *ja* opened *javũ*. Three bare consonants carrying their built-in *a*, then the ending: *sa-ma-ja-vũ*.

The word, taken apart — its roots and family

samajvũ comes from Sanskrit *sambudhyate*: **sam**- “together, fully,” on the root **budh**-, “**to wake, to become aware**.” To understand is to come awake to a thing.

That root named a person too. One who has fully woken is a **buddha** — the title is this root with a participle ending, and it means exactly “the awakened one.”

It is Indo-European as well, **bheudh*-, and English keeps it in quieter clothes. Old English *bēodan*, “to announce, to offer,” left **bode** and **forebode** — to bode ill is to give warning, which is what a waking mind does — and **forbid**, an announcement pointed the other way.

What you’ve built: a cluster that assimilated, then simplified

Sambudhyate has a **dh**y in the middle; Gujarati has a plain **j**. Two steps did that, in this order. **Assimilate**: the *dh* was remade in the shape of

the *y* after it, both landing on the palate, and the pair came out doubled as **jy** — Prakrit *saṃbujjhadī*. **Simplify:** the double then fell to a single **j**, giving *samaj-*.

You have watched this pair once already. Count to two: *be*. Its *dv-* went to **bb** because the *d* was remade in the shape of the *v* beside it, and the double then simplified to **b**. Different letters, same two moves.

Your turn

- *Say it:* **samajvũ**, then **hũ samajũ chhũ** — I understand
- *Trace it:* *sambudhyate* → *saṃbujjhadī* → **samaj-**: assimilate, then simplify
- *Match:* the same two moves in *dv* → *bb* → **b**, which gave you *be*
- *Connect:* **budh-** “to wake” → **buddha**, and English **bode**, **forbid**
- *Run through:* **jāpvũ**, **vichārvũ**, **samajvũ** — know, think, understand

Before you move on

What did the root behind *samajvũ* mean, and which famous title is the same root? (“To wake, to become aware”; **Buddha**.) Name the two steps from *dhy* to *j*, and the number that took the same two. (Assimilate, then simplify; *be*, from *dv* to *bb* to *b*.) Say “I understand.” (*Hũ samajũ chhũ*.)
Source: Wiktionary: સમજવું.

8.3 વાંચવું — “to read,” which is making a page speak

Hũ samajũ chhũ — and what did that root mean first? Then *vichārvũ*. The next verb puts the words in front of you.

You’ll want to know first — one word

વાંચવું — *vāchvũ* — to read

The stem is **વાંચ-** *vāch-*, and nothing new happens after it: *hũ vāchũ chhũ*, “I read.”

The letters in this word

૧૩ is ૧ *va* with the long-*ā* sign, and the dot ̣ sits on top of it. Then ૨ *cha*, the letter you counted *chār* with and thought with in *vichār*. Then ૩. *Vā-cha-vũ* — and the dot in the middle is the piece to be careful about.

What you’ve built: a nasal that is not at the end

Every nasal dot so far has been at the **end** of a word: *hũ*, *chhũ*, and the -૩ on every verb. This one is in the **middle**, doing the same job in a new place — the *ā* before ૨ goes through the nose, and it must be heard as well as written. Count to five and stop on ૫૩ *pāch*: same dot, same position, same nasal *ā* running into a ૨.

And you know how much one small mark can carry. જ૩ *javũ* is “to go” and જ૩૩ *jovũ* is “to see,” and the whole difference is the sign on the જ. This dot is the same kind of hinge: small enough to skip, and not skippable.

The word, taken apart — its roots and family

vāchvũ comes through Old Gujarati from Sanskrit *vācayati*, a **causative**: the root **vac-** means “to speak,” so *vācayati* is “**to make speak**.” Reading was named as making a silent page talk — which is what reading was, aloud, for most of the time people have done it. The root is Indo-European, **wekw-*, and Latin holds it as *vōx*, “voice.” English took the family whole: **voice**, **vocal**, **vowel**, **vocation** (a calling), **advocate** (one called to your side), **provoke**, **revoke**.

Your turn

- *Say it*: **vāchvũ**, then **hũ vāchũ chhũ** — I read
- *Match*: the same middle nasal in **pāch**, “five”
- *Contrast*: **javũ** and **jovũ** — one mark decides which word it is
- *Trace it*: **vac-** “speak” → *vācayati* “make speak” → **vāchvũ**, and → **voice**, **vowel**, **advocate**
- *Run through*: **vichārvũ**, **samajvũ**, **vāchvũ**

Before you move on

Where does the nasal dot sit in *vāchvũ*, and which number of yours carries it in the same place? (In the middle, on the *ā*; *pāch*.) What did *vācayati* mean literally, and which English word for the thing you speak with is its cousin? (“To make speak”; **voice**.) Say “I read.” (*Hũ vāchũ chhũ*.)

Source: Wiktionary: લખવું.

8.4 લખવું — “to write,” which began as scratching

Three verbs, three pictures: *vichārvũ* on a root meaning **to range about**, *samajvũ* on one meaning **to wake**, *vāchvũ* on one meaning **to speak**. The fourth root is the most physical of them.

You’ll want to know first — one word

લખવું — *lakhvũ* — **to write**

The stem is લખ- *lakh-*, and now you can say something worth saying:
હું મારું નામ લખું છું — *hũ mārũ nām lakhũ chhũ* — “**I write my name.**”

The letters in this word

Both letters are already yours. લ *la* stood in *bolvũ*, “to speak.” ખ *kha* is the puffed *k* of *khāvũ*, “to eat.” *La-kha-vũ*.

The word, taken apart — its roots and family

lakhvũ comes through Prakrit from Sanskrit *likhati*, and **likh-** meant “**to scratch, to score**” long before it meant to write. Its plainest Sanskrit relative says so out loud: रेखा *rekhā*, “a line, a streak.” Beyond Indo-Aryan the cousins are disputed, and this lesson claims none — the same answer *khāvũ* gave. What is not disputed is that three families reached for one picture: Latin *scribere* also meant **to scratch**, behind **scribe** and **script**, and English **write** began as Germanic “to score.”

What you've built: four verbs, and what each root did first

verb	what its root did first
<i>vichārvū</i> — think	ranged about, turned
<i>samajvū</i> — understand	woke up
<i>vāchvū</i> — read	spoke
<i>lakhvū</i> — write	scratched

Not one of the four began as a mental act. The mind gets its vocabulary from the body, every time.

Three habits ran through the chapter. A cluster **assimilates and then simplifies** — *dhy* to *jjh* to *j* in *samajvū*, whose root *budh-* also gave **buddha**. A **dot in the middle** is a nasal you must hear — *vāch-*, whose root *vac-* also gave **voice**. And when the trail stops you say so: *lakh-* and *khāvū* have no secure English cousin, *jovū*'s origin is probable rather than proven, and *jāṇvū* is the one that paid out, being English **know**.

Your turn

- *Produce*: **hū mārū nām lakhū chhū** — I write my name
- *Run through*: **vichārvū, samajvū, vāchvū, lakhvū** — stripping **-vū** off each
- *Name*: what each root did first — ranged, woke, spoke, scratched
- *Say it*: the two steps behind *samaj-*, and where the dot sits in **vāchvū**
- *Connect*: **rekhā**, still meaning the scratch

Before you move on

Say “I write my name.” (*Hū mārū nām lakhū chhū*.) Name the four verbs and what each root did before it meant a mental act. (Ranged, woke, spoke, scratched.) Which Sanskrit word is *lakh-*'s plainest relative? (**Rekhā**, “a line.”) Which of your verbs has a certain English cousin, and which have none? (*Jāṇvū* is **know**; *lakh-* and *khāvū* have none.)

Source: Wiktionary: ॐ.

Chapter 9

Taking, Asking, Helping, Liking

By the end of this chapter: I can take, ask, help and say what I like in Gujarati, explain why મદદ કરવી ends in the feminine -ી while કામ કરવું ends in the neuter, and say why મને ગુજરાતી ગમે છે leaves no room for me as its subject.

Say મને ગુજરાતી ગમે છે and hear that you are not its subject, set it against હું ગુજરાતી બોલું છું where you are, trace ગમવું back to gamyate — the passive of gam- ‘to go’, so the verb was born without a doer and is English come besides — and run the chapter’s four verbs back with where each came from: Sanskrit prek- behind pūchhvũ, lebh- behind levũ, Arabic madad through Persian, and the feminine ending madad forces onto karvĩ.

9.1 લેવું — “to take,” and a family tree with an argument in it

Lakhvũ and *vāchvũ* — and what was *lakh-* doing before it wrote anything? (**Scratching.**) The next verb is shorter than either.

You’ll want to know first — one word

લેવું — *levũ* — to take

Take the ending off and almost nothing is left: the stem is one syllable, લે- *le-*.

The letters in this word

ღ is ლ *la*, met in *lakhvũ* one lesson ago, wearing the sign ჲ that turns it into *le* — the same sign sitting on ღ *chhe* at the end of your sentences. Then ჳ.

Grammar Lens: the stem relaxes when a person arrives

ღ ლ ჳ ღ — *hũ laũ chhũ* — “I take.”

The stem was *le-* and its vowel has relaxed to *a* under the person-ending. That is the old rule seen from the other side: *javũ*’s stem *ja-* **stretched** to *jā-* when a person-ending arrived. A one-syllable stem is the piece most likely to move; the ending and the copula behind it never do.

The word, taken apart — its roots and family

levũ comes through Prakrit *lei* from Sanskrit *labhate*, “takes, gains, obtains” — the *bh* worn away between the vowels, as a *d* was in *khāvũ*. The root is Indo-European, **lebh-*, and its meaning is worth holding: not “seize” but “**work, harvest, gain, profit.**” Taking, named as what you have earned.

The secure cousins are outside English: Lithuanian *lōbis*, “treasure,” and Greek *lāphura*, “spoils of war.” Both keep the sense of a thing gained rather than grabbed.

Then the argument. Latin *labor*, “toil” — English’s **labour, laboratory, elaborate** — is often traced to this same root, which would make working and taking one word. That link is contested, and at least one standard authority rejects it. So: **probable, not proven**, exactly as *jovũ* was.

Three settings on one dial. *Jāṇvũ* is **certain** — it is English **know**. *Levũ* and *jovũ* are **disputed**. *Khāvũ* has **nothing**, and you say so.

Your turn

- *Say it:* **levũ**, then **hũ laũ chhũ** — the stem relaxing under the ending
- *Match:* *le-* to *la-* here, *ja-* to *jā-* in **javũ**
- *Trace it:* *labhate* “gains” → **levũ**, the *bh* worn away
- *Sort:* **jāṇvũ** certain and English **know**; **levũ** and **jovũ** disputed; **khāvũ** nothing

- *Run through:* vāchvũ, lakhvũ, levũ

Before you move on

Say “I take.” (*Hũ laũ chhũ.*) Did the root behind *levũ* mean seizing or earning? (Earning: “work, harvest, gain.”) Is English **labour** a cousin? (Possibly — the link is both made and rejected, so probable, not proven.) Which verb of yours has a **certain** English cousin, and which has **none**? (*Jāṇvũ* is **know**; *khāvũ* has none.)
Source: Wiktionary: འཇུ.

9.2 ཡུཅུ — “to ask,” the verb English kept for praying

Hũ laũ chhũ — did the root behind *levũ* mean seizing or earning? (**Earning.**) Here is the verb for the one thing you cannot take: an answer.

You’ll want to know first — one word

ཡུཅུ — *pūchhvũ* — to ask

The stem is ཡུཅ- *pūchh-*, and the present holds no surprises: *hũ pūchhũ chhũ*, “I ask.”

The letters in this word

ཡ is *pa*, counted with in ཡེལ *pāch*. On it sits a new sign: ུ, the **long** *ū*, a heavier hook than the short ུ on every -ཇུ. Two different vowels, not two speeds of one. Then ཅ *chha*, opening ཅ *chhe*.

What you’ve built: a p that stayed because of where it stood

You know a rule that eats *p*: **a single Sanskrit *p* between two vowels softened to *v***. It is how *āpayati*, on a root meaning “reach,” became འཇུ *āvũ*.

So why does *pūchhvũ* still open with a hard ཡ? Because the condition is the whole rule: that *p* is not between vowels, it is at the **front** of the word, where nothing softened it. Count to five for the same shelter — ཡེལ *pāch* keeps its *p*.

A sound law you can only recite is a fact. One whose condition you can check is a tool.

The word, taken apart — its roots and family

pūchhvũ comes from Sanskrit *pr̥chatī*, “asks,” on the Indo-European root **prek-*, “to ask.” This one paid out generously.

Latin took it as *precārī*, “to beg, to entreat,” and English has the family: **pray**, **prayer**, **deprecate**. Latin also made *precārius*, “held only so long as another allows it,” English’s **precarious** — a thing you keep by asking. German still says *fragen*, Persian *porsīdan*.

English is the odd one out. Its own inherited cousin, Old English *frignan*, died out and **ask** came from elsewhere, so the root survives in English only in its religious clothes. Saying *hũ pūchhvũ chhvũ*, you use the verb English kept for **praying**.

Your turn

- *Say it:* **pūchhvũ**, then **hũ pūchhvũ chhvũ** — I ask
- *Contrast:* short ॠ in -ॠ, long ॡ in ॡ
- *Explain:* why **āvvũ** lost its *p*, and **pūchhvũ** and **pāch** kept theirs
- *Trace it:* *pr̥chatī* → **pūchhvũ**, and → **pray**, **precarious**, *fragen*
- *Run through:* **lakhvũ**, **levũ** from *lebh-*, **pūchhvũ**

Before you move on

Say “I ask.” (*Hũ pūchhvũ chhvũ*.) Why did *pūchhvũ*’s *p* survive when the one inside *āvvũ*’s ancestor did not, and which number of yours is sheltered the same way? (It stands at the front, not between vowels; *pāch*.) Which English word for addressing a god is its cousin? (**Pray**.) Source: Wiktionary: ॠॡॢ.

9.3 ॠॡॢ ॠॡॢ — “to help,” which is a hand held out

Pūchhvũ and *levũ* — and which English word for talking to a god is *pūchhvũ*’s cousin? (**Pray**.) Now, what you do once someone has asked.

You'll want to know first — one phrase

મદદ કરવી — *madad karvī* — **to help**

Two words. મદદ *madad* is a noun, “help”; કરવું *karvũ* is “to do,” yours since *kām karvũ*. Gujarati helps by **doing help**.

હું મદદ કરું છું — *hũ madad karũ chhũ* — “**I help.**”

The letters in this word

મદદ is three bare consonants with their built-in *a*: મ *ma*, then a doubled દ *da* — the દ that ends *ānand*. In કરવી the last letter wears the long ી you met in *maḷīshũ*, and that ી is what this lesson is about.

Grammar Lens: the ending that stopped being neuter

Every Gujarati verb so far has been named in the **neuter**: -વું *-vũ*, the third of the three genders, the *-ũ* of *sārũ* and *mārũ*. This one is not. કરવી *karvī* wears *-ī*, the **feminine** of *sārī* and *mārī*, because મદદ is a **feminine** noun and the infinitive agrees with what is done:

- કામ કરવું *kām karvũ* — “to work.” *Kām* is neuter, so *karvũ*.
- મદદ કરવી *madad karvī* — “to help.” *Madad* is feminine, so *karvī*.

Gujarati keeps three genders where Hindi next door keeps two, and here that system does visible work. You have watched gender decide a form once before, at the other end of a word's life: બે *be* comes down from Sanskrit's feminine and neuter *dvé*, not the masculine *dváu*. Gender chose the ancestor there; it chooses the ending here.

The word, taken apart — its roots and family

મદદ is not Sanskrit at all. It is **Arabic** *madad*, borrowed through **Persian**, on the root **m-d-d**, “**to stretch out, to extend**” — whose plainest sentence is “extend your hand.” *Madad* is a thing held out: a hand, or reinforcements sent to an army.

It belongs to a layer you have tasted. Gujarati was a great trading tongue of the Arabian Sea, and the Persian and Arabic that settled into it is the layer answering “how are you” with મજા *majā*.

Your turn

- *Say it:* **madad karvī**, then **hū madad karū chhū** — I help
- *Contrast:* **kām karvū** neuter, **madad karvī** feminine — the noun decides
- *Trace it:* Arabic *m-d-d* “extend” → Persian → **madad**, beside **majā**
- *Run through:* **levū**, **pūchhvū**, **madad karvī** — gender picking an ending here, an ancestor in **be**

Before you move on

Say “I help.” (*Hū madad karū chhū.*) Why *karvī* and not *karvū*? (મદદ is feminine; *kām* is neuter.) Where is *madad* from, and which count of yours was also shaped by gender? (Arabic through Persian, a root meaning “to stretch out”; **be**, from *dvé*.)
Sources: Wiktionary: મદદ; Wiktionary: Arabic madad.

9.4 ગમવું — “to like,” which is not something you do

Three verbs from this chapter: *levū*, *pūchhvū*, *madad karvī*. Each let you act. The fourth will not.

You’ll want to know first — one word

ગમવું — *gamvū* — **to like**

The infinitive wears the neuter -વું like every verb you own. What comes next does not.

The letters in this word

ગ *ga* opened *gujarātī*, મા *ma* has been everywhere, then ડું — three shapes floating free, no bar across their tops, the fastest tell of Gujarati.

Grammar Lens: you are not the subject of this sentence

મને ગુજરાતી ગમે છે — *mane gujarātī game chhe* — **I like Gujarati**

Word for word: “**to me** Gujarati **pleases**.” No *hũ* anywhere. મને *mane* is “to me,” carrying the -ને *-ne* of તમને *tamne*.

- હું ગુજરાતી બોલું છું — I speak Gujarati. **I** am the doer.
- મને ગુજરાતી ગમે છે — I like Gujarati. **Gujarati** is.

The verb answers to *gujarātī*, not to me — the instinct behind *madad karvī*. Spanish reaches this shape in *me gusta*, Tamil in *enakku piḍikkum*, neither borrowing from Gujarati nor from each other. Hindi and Urdu use the Persian loan *pasand*; *gamvũ* is Gujarati’s own inherited word.

The word, taken apart — its roots and family

gamvũ is Old Gujarati *gamaĩ*, “to please,” from Prakrit *gammaĩ*, “**is known**,” from Sanskrit *gamyate* — the **passive** of **gam-**, “**to go**.” “It is gone to” became “it is grasped” became “it pleases.” The word was born doerless and never took one.

Two things you hold fall into place. *Gamaĩ* meant “is known,” the work of જાણવું *jāṇvũ*. And *gamyate* holds a **y** that did **not** become *j*: that rule was for Sanskrit *y-* at the **front** of a word, as in *javũ*. This one stood against an *m*, was swallowed into it, and the doubled *mm* thinned — assimilate, then simplify, as *samajvũ* did.

The root is **gwem-*, and English **come** is the same word; Latin *venīre* gave **advent**, **venue**, **invent**. *Āvvũ* runs off another root, one that meant “**to reach**.”

Your turn

- *Produce*: **mane gujarātī game chhe**, then **hũ gujarātī bolũ chhũ** — naming the doer in each
- *Run through*: **levũ** from *lebh-* “gain”, **pũchhvũ** from *prek-* “ask”, **madad** from Arabic through Persian, **gamvũ** from a passive — and why *karvī* ends in *-ī*
- *Trace it*: *gam-* “go” → *gamyate* → **gamvũ**, and → **come**, **advent**
- *Explain*: why *gamyate*’s *y* did not become *j* as *javũ*’s did
- *Match*: *gammaĩ* “is known” against **jāṇvũ** and **know**; *gam-* against *āvvũ*’s “reach”

Before you move on

Say “I like Gujarati,” and name its subject. (*Mane gujarātī game chhe; Gujarati.*) Which Sanskrit form is *gamvũ* from, what kind is it, and which English verb is the same word? (*Gamyate*, the **passive** of *gam-*; **come**.) Why *madad karvī*? (*Madad* is feminine.)
Sources: Wiktionary: ગમવું; Wiktionary: Sanskrit gamyate.

Chapter 10

Water, Tea, Milk, and Bread

By the end of this chapter: I can politely ask for water, tea, milk, or bread in Gujarati, name which of the four is a loanword and which have no settled root beyond Sanskrit, and explain why a word ending in $-ī$ is not automatically feminine.

The chapter closes on રોટલી, the request that breaks the drink pattern: the reader produces all four requests with મહેરબાની કરીને, sorts પાણી and દૂધ (inherited, known root) against ચા (loaned from Chinese by the overland route) against રોટલી (inherited, root unknown), and uses પાણી's neuter gender despite its $-ī$ ending to show that રોટલી's own feminine $-ī$ is a hint, not a rule.

10.1 પાણી — the first thing you'll actually ask for

Gamvũ let you say what you like; *madad karvī* let you ask for help. This chapter asks for something smaller and more frequent: a drink.

You'll want to know first — one word

પાણી — *pāṇī* — water

The letters in this word

પ *pa*, ા the long- $\bar{a}$ sign, ણ the retroflex η you already curled back in *jāṇvũ*, then ી long- $\bar{i}$. No bar runs across the top of any of them — the headless tell, working the same way in a noun as it did in a verb.

Grammar Lens: asking politely

પાણી, મહેરબાની કરીને. — *pāṇī, meherbānī karīne*. — **Water, please.**

મહેરબાની કરીને *meherbānī karīne* is built from મહેરબાની, “kindness” or “favor,” plus કરીને, “having done” — the same કરીને/કરવી family you met in મદદ કરવી, “to do a favor of help.” Literally: “having done a kindness.” Name the item, add this, and you have a complete polite request with no verb for “give” needed at all — the pattern this whole chapter will reuse.

The word, taken apart — its roots and family

pāṇī comes from Sanskrit **pānīya**, “that which is to be drunk,” built on **pā-**, “to drink.” That root is Indo-European, **peh₃(i)-*, and English holds two disguised pieces of it: **potion** and **poison** both come through Latin *potare*, “to drink” — a poison, etymologically, is just a drink gone wrong. Greek turned the same idea into *sympotēs*, “one who drinks together,” which English keeps as **symposium**. *Pāṇī* is not a stranger to those words; it is what “to drink” looks like when it never left the family that gave you *jāṇvū*’s Sanskrit cousin *jñā-*.

Your turn

- *Say it:* **pāṇī** — water
- *Say it:* **pāṇī, meherbānī karīne**. — water, please
- *Match:* **karīne** against **madad karvī**’s own **kar-** root
- *Trace it:* **pā-** “to drink” → **pāṇī**, and → **potion, poison, symposium**
- *Run through:* **mane gujarātī game chhe**, then **pāṇī, meherbānī karīne** — liking and requesting, side by side

Before you move on

Ask for water politely. (*Pāṇī, meherbānī karīne*.) What does *meherbānī karīne* mean word for word? (“Having done a kindness.”) Which two English words for a drink, and one for a whole gathering

of them, share *pāṇī*'s root? (**Potion, poison, symposium.**)
 Sources: Wiktionary: પાણી; Wiktionary: મહેરબાની.

10.2 ચા — the tea that went overland

Pāṇī, meherbānī karīne — water, please. The next drink uses the exact same pattern, and its own name has traveled further than water's ever needed to.

You'll want to know first — one word

ચા — *chā* — tea

ચા, મહેરબાની કરીને. — *chā, meherbānī karīne*. — Tea, please.

The letters in this word

ચ *cha* — the same letter that opened *chār*, “four,” and sat inside *vichār* — plus the long-*ā* sign. Two letters, both already yours.

The word, taken apart — its roots and family

ચા is a loanword — unlike **pāṇī**, which Gujarati has owned since Sanskrit. It came through Classical Persian *chā*, from Mandarin Chinese **chá**. That is the **overland** route, out through Central Asia and Persia: Hindi and Urdu *chāy*, Russian *chai*, Turkish *çay* all took the same road and the same syllable.

There is another route entirely. Chinese merchants on the coast spoke a different dialect, Hokkien, where the same word is *tê*. Dutch sailors picked that form up by **sea** and carried it into Europe: English **tea**, French *thé*, German *Tee*. One plant, one original Chinese word, and two pronunciations of it, sorted by whether a language met the word on a caravan route or a ship's deck. Gujarati's *chā* and English *tea* are, in that exact sense, the same word taken two different ways out of the same country.

Your turn

- *Say it*: **chā** — tea, and **chā, meherbānī karīne** — tea, please

- *Run through:* both requests — **pāṇī, meherbānī karīne; chā, meherbānī karīne**
- *Trace it:* Chinese *chá* → Persian *chā* → ચા, the overland road
- *Name:* one language that took the sea road instead, and its word (English, **tea**)

Before you move on

Ask for tea politely. (*Chā, meherbānī karīne.*) Did *chā* come by land or by sea? (**Land** — through Persian, from Mandarin.) Which English word for the same plant took the sea route instead, and through which language? (**Tea**, through Dutch.)

Sources: Wiktionary: ચા; Etymonline: chai.

10.3 દૂધ — a verb frozen into a noun

પાણી was never borrowed. ચા came the long way from China. The third drink is, like water, entirely Gujarati's own — but it got that way differently.

You'll want to know first — one word

દૂધ — *dūdh* — **milk**

દૂધ, મહેરબાની કરીને. — *dūdh, meherbānī karīne.* — **Milk, please.**

The letters in this word

દ *da*, ડ the long-*ū* sign below it, then ધ *dha* — the aspirated *d*, the same puff of breath that made ખ the aspirated *k* and બ the aspirated *b*. You have met the letter itself before, in વાંધો નહીં.

The word, taken apart — its roots and family

dūdh comes from Sanskrit **dugdha**, and *dugdha* is not, at root, a noun at all — it is the **past participle** of **duh-**, “to milk,” so it means literally “**milked**.” The action came first; the word for the substance is just that verb, frozen. It is the same trick *gamvū* played with “to please,” run on a different part of speech: a verb collapsing into the thing it names.

The Indo-European root is **dheugh-*, “to be fit, useful, of avail.” Its Germanic descendant did not go on to mean milk in English at all — it survives in **doughty**, “valiant, capable,” from Old English *dohtig*, “of good use.” *Dūdh* and *doughty* are cousins by way of a root that once meant simply **being of use** — milk as *the useful thing*, valor as *the useful person*.

Your turn

- *Say it:* **dūdh** — milk, and **dūdh, meherbānī karīne** — milk, please
- *Run through:* all three requests so far — **pāṇī, chā, dūdh**, each with *meherbānī karīne*
- *Trace it:* *duh-* “to milk” → *dugdha* “milked” → **dūdh**, and → English **doughty**
- *Name:* which of the three drinks is a loanword (ਘੁਲ) and which two are not

Before you move on

Ask for milk politely. (*Dūdh, meherbānī karīne.*) What part of speech was *dugdha* before it became a noun for milk? (A **past participle** — “milked.”) Which unexpected English word for bravery shares its root with *dūdh*? (**Doughty.**)

Sources: Wiktionary: ਘੁਲ; Etymonline: doughty.

10.4 ਰੋੜਥੀ — a request pattern, run four times

Three drinks, one pattern: **pāṇī, chā, dūdh**, each followed by *meherbānī karīne*. The fourth request is food, not drink, and it closes the chapter by finally breaking a pattern instead of continuing one.

You’ll want to know first — one word

ਰੋੜਥੀ — *roṭhī* — flatbread

રોટલી, મહેરબાની કરીને. — *roṭlī, meherbānī karīne.* — **Bread,**
please.

The letters in this word

ર *ra*, ે the *o* sign, then a new letter: ઢ, a retroflex *ṭ* — the tongue curls back the way it does for ઢ, but here it stops the airflow instead of letting it through the nose. Then લ *la*, and ી long-*ī*. Headless throughout, like every letter you’ve met.

Grammar Lens: an -ī that does not mean “feminine, guaranteed”

રોટલી is feminine, and its ending fits: many Gujarati nouns ending in -ī are feminine, the same -ī you saw mark the feminine adjective ending in *sārī*. But you already own the counter-example: પાણી also ends in -ī, and *pāṇī* is **neuter**. The ending is a hint worth noticing, not a rule you can trust blind — every noun’s gender has to be learned with the noun, the way *madad karvī* forced કરવી into its feminine shape only because *madad* itself was feminine, not because of any ending on *karvī* alone.

The word, taken apart — its roots and family

roṭlī is inherited from Sanskrit **roṭikā**, “a kind of bread.” That much is certain. What *roṭikā* itself comes from is not: the standard comparative dictionaries weigh an unattested root meaning “to strike against” against another meaning “to crush,” and neither Turner nor Mayrhofer picks a winner.

That gives this chapter its own three-way dial, the same shape *jāṇvũ*, *levũ*, and *khāvũ* once drew for verbs: **pāṇī** and **dūdh** are inherited straight from Sanskrit with a full etymology behind them; **chā** is a loan, traceable to Mandarin by a known road; **roṭlī** is inherited too, but its own root is where recorded history simply stops.

Your turn

- *Say it:* **roṭlī, meherbānī karīne** — bread, please
- *Run through:* all four requests — **pāṇī, chā, dūdh, roṭlī**, each with *meherbānī karīne*

- *Sort:* inherited with a known root (**pāṇī**, **dūdh**), loaned (**chā**), inherited with an unknown root (**roṭlī**)
- *Contrast:* **roṭlī** feminine by its **-ī**, **pāṇī** neuter despite its **-ī**

Before you move on

Ask for bread politely. (*Roṭlī, meherbānī karīne.*) Does *roṭikā*'s own root have a settled answer? (**No** — the dictionaries disagree and leave it open.) Name one Gujarati noun ending in **-ī** that is feminine and one that is neuter. (**Roṭlī; pāṇī.**) Run all four requests from this chapter. (*Pāṇī, chā, dūdh, roṭlī*, each with *meherbānī karīne.*)
Sources: Wiktionary: રોટલી; Wiktionary: Sanskrit rotika.

Chapter 11

Friend and Family

By the end of this chapter: I can name a friend, a family, a brother, and a sister in Gujarati, explain which of these words was inherited whole from Sanskrit rather than worn down by sound change, and say which sibling word is genuinely a cousin of its English counterpart and which is not.

The chapter closes on બહેન, deliberately not a cousin of English sister: the reader produces મિત્ર, કુટુંબ, ભાઈ and બહેન, names ભાઈ as English brother’s unbroken cousin against બહેન’s unrelated (disputed bhaga-based) root, and names કુટુંબ as taken up whole from Sanskrit rather than worn down like the other three — while recalling that મિત્ર and મહેરબાની, taught a chapter apart, share the same ancient Indo-Iranian root.

11.1 મિત્ર — a friend, and the word inside your own “please”

Last chapter asked politely for **roṭlī** with *meherbānī karīne*. That phrase is about to turn out to share its root with the very first word of this new chapter.

You’ll want to know first — one word

મિત્ર — *mitra* — friend

The letters in this word

૫ *ma*, િ the short-*i* sign written **before** the consonant it belongs to — the same leftward quirk you saw open *vichārvū* — then a conjunct: ા — ટ *ta*

with the virama ્ stripping its vowel, joined straight into ર *ra*. *Mi-tra*, two syllables, the second one a cluster.

The word, taken apart — its roots and family

mitra is Sanskrit for “friend,” from Proto-Indo-Iranian *mitras*, “(that which) causes binding” — a covenant word before it was a friendship word. Its exact twin is Avestan **Mithra**, the god of contracts and given word, whose name lived on in Middle Persian as **Mihr**.

That is not a dead end. મહેરબાની, the “kindness” you built *meherbānī karīne* from last chapter, is Persian *mihrbānī* — built on that very same **Mihr**. So મિત્ર, inherited straight down from Sanskrit, and મહેરબાની, borrowed centuries later from Persian, are cousins by the same Indo-Iranian root — one word for “friend,” the other for “favor,” both once naming the same idea of a bond that holds.

Your turn

- Say it: **mitra** — friend
- Trace it: Proto-Indo-Iranian *mitras* → Avestan **Mithra** → Persian **Mihr** → મહેરબાની
- Connect: મિત્ર and મહેરબાની — same ancient root, two different doors into Gujarati
- Run through: **roṭlī**, **meherbānī karīne** once more, now naming the “friend” root inside it

Before you move on

Give the word for “friend.” (*Mitra*.) Which other Gujarati word you already know shares its root, and through which language did each arrive? (મહેરબાની — *mitra* inherited from Sanskrit, *meherbānī* borrowed from Persian *mihra*.) What did the shared root originally mean? (“**To bind**,” a covenant.)

Sources: Wiktionary: મિત્ર; Wiktionary: Mithra.

11.2 કુટુંબ — a word that skipped the sound changes

મિત્ર reached Gujarati the long way, worn down through Prakrit like nearly every word you own. The word for the group a friend

gets folded into took a different road entirely.

You'll want to know first — one word

कुटुम्ब — *kuṭumb* — family

The letters in this word

क *ka*, उ the short-*u* sign below it, then ढ — the same retroflex *ṭ* you first curled back in *roṭḷā*, here doing the same job again. ण closes it: *u* with the nasal dot on top, then ब *ba*. *Ku-ṭu-m-b*.

Grammar Lens: taken whole, not worn down

You have seen Sanskrit reach back into Gujarati once before: र's *r*, restored after Prakrit had already dropped it — a **repair**, made to a word that had kept changing the whole time. कुटुम्ब is a different kind of contact. Gujarati did not inherit this word through the centuries of sound change that gave you *pāṇī* or *be*; it took the Sanskrit word up **directly**, close to whole, the way a modern language reaches for a ready-made technical term instead of growing one on its own. Linguists call an inherited word like *pāṇī* **tadbhava**, “born from that,” and a direct borrowing like this one **tatsama**, “same as that” — *kuṭumb* is tatsama.

The word, taken apart — its roots and family

Here the trail runs further than usual, in an unexpected direction. Sanskrit **kuṭumba** is itself thought to be a **loanword**, taken from a Dravidian source and compared to Tamil *kuṭimai*, “family, lineage,” both built on *kuṭi*, “hut.” A word that looks purely Sanskrit, and that Gujarati then borrowed as purely Sanskrit, may have entered Sanskrit from a completely different family of languages first. The chain of ownership runs Dravidian → Sanskrit → Gujarati, with no step skipped and no step certain beyond reasonable comparison.

Your turn

- *Say it:* **kuṭumb** — family
- *Contrast:* **tadbhava** *pāṇī* (worn down over time) against **tatsama** *kuṭumb* (taken whole)

- *Match:* this “taken whole” idea against *traṇ*’s restored *r* — both are Sanskrit reaching forward, in different ways
- *Trace it:* proposed Dravidian *kuṭi* “hut” → Sanskrit *kuṭumba* → કુટુંબ

Before you move on

Give the word for “family.” (*Kuṭumb*.) Is it *tadbhava* or *tatsama*? (**Tatsama** — borrowed whole from Sanskrit, not worn down through Prakrit.) Where does Sanskrit’s own *kuṭumba* likely come from? (**Dravidian**, compared to Tamil *kuṭimai*.) Sources: Wiktionary: કુટુંબ; Wiktionary: Sanskrit kutumba.

11.3 ભાઈ — the same word as “brother,” unbroken

કુટુંબ was taken up whole, close to the finished Sanskrit shape. The two words for its members run the opposite way — worn all the way down, the ordinary path nearly every Gujarati word has followed.

You’ll want to know first — one word

ભાઈ — *bhāī* — brother

The letters in this word

ભ *bha*, the aspirated *b*, with the long-*ā* sign ા, then ઈ, the independent long-*ī* vowel standing on its own rather than attached to a consonant. *Bhā-ī*, two syllables, no consonant closing the second.

The word, taken apart — its roots and family

bhāī is inherited, through Prakrit *bhāī*, from Sanskrit **bhrātr̥**. Its root is Indo-European **b^hréh₂tēr*, and this is one of the cleanest cognate sets Indo-European linguistics has: Sanskrit *bhrātr̥*, English **brother**, Latin *frāter*, Greek *phrātēr*, Russian *brat* — every one of them the same word, carried down by ordinary sound change in every branch rather than borrowed by any of them. Where *kuṭumb* skipped the centuries of change that shape *tadbhava* words, *bhāī* is the textbook case of what those centuries do: the consonant cluster *bhr-* simplified once the *r* dropped,

exactly the kind of wearing-down that gave you *pāṇī* from *pānīya*.

Your turn

- *Say it:* **bhāī** — brother
- *Trace it:* PIE *b^hréh₂tēr* → Sanskrit *bhrātṛ* → **भ्रातृ**, and → English **brother**
- *Contrast:* *bhāī* worn down over centuries against *kuṭumb* taken up whole
- *Name:* two other languages whose word for “brother” is the same cognate (Latin *frāter*, Greek *phrātēr*, or Russian *brat*)

Before you move on

Give the word for “brother.” (*Bhāī*.) Which English word is the very same word, by unbroken descent, not borrowing? (**Brother**.) Is *bhāī* *tadbhava* or *tatsama* — worn down, or taken whole like *kuṭumb*? (**Tadbhava** — worn down.)
Sources: Wiktionary: **भ्रातृ**; Wiktionary: *b^hréh₂tēr*.

11.4 **बाहेन** — the sister who is not “sister”’s cousin

भ्रातृ is English **brother**, unbroken, down to the root. Do not assume the sibling pair matches. This chapter’s last word breaks the pattern.

You’ll want to know first — one word

बाहेन — *bahen* — **sister**

The letters in this word

बा *ba*, **हे** *ha*, **े** the *e* sign above the consonant, then **न** *na*. *Ba-hen*, every letter already yours from earlier chapters.

The word, taken apart — its roots and family

Here is the surprise: બહેન is **not** *bhāī*’s counterpart the way English *sister* is *brother*’s. English *sister*, Latin *soror*, and Sanskrit **svasṛ** all descend from one shared PIE root, **swésōr*. Gujarati’s word for sister does not use that root at all.

bahen comes from Sanskrit **bhaginī**, through Prakrit *bhaginī*. Scholars connect *bhaginī* to **bhaga**, “good fortune, a share” — the same *bhaga* behind *bhāgya*, “fate” — plus a feminine suffix, so “sister” may originally have meant something closer to “**the one who shares**.” That connection is debated rather than settled, the way *rotlī*’s root was: some scholars accept the *bhaga* link, others have argued against it. What is certain is what it is **not**: unlike *bhāī*, *bahen* is no relation to English *sister* at all — and unlike the disputed-but-real *mitra*/*meherbānī* pair, this dial lands on “unrelated,” full stop.

Your turn

- *Say it*: **bahen** — sister, and **bhāī** — brother
- *Contrast*: *bhāī* — same root as English *brother*; *bahen* — a different Sanskrit word entirely, not *sister*’s cousin
- *Trace it*: proposed *bhaga* “share, fortune” → *bhaginī* → બહેન
- *Run through*: all four family words — **mitra**, **kuṭumb**, **bhāī**, **bahen** — inherited/borrowed, direct/indirect
- *Recall*: મિત્ર and મહેરબાની’s shared root from the last chapter, and કુટુંબ’s proposed Dravidian root

Before you move on

Give the word for “sister.” (*Bahen*.) Is it the same root as English *sister*? (**No** — that connection belongs to *bhāī*/**brother** instead.) What does *bahen* probably come from? (Sanskrit *bhaginī*, disputedly tied to *bhaga*, “share.”) Name this chapter’s four people and things: friend, family, brother, sister. (*Mitra*, *kuṭumb*, *bhāī*, *bahen*.) Sources: Wiktionary: બહેન; Wiktionary: Sanskrit *bhagini*.

Chapter 12

Eye, Ear, Mouth, and Nose

By the end of this chapter: I can name the eye, ear, mouth, and nose in Gujarati, tell a nasal that only marks a sound from one that marks the neuter gender, and say which two of the four are unbroken cousins of their English counterparts.

The chapter closes on નાક, completing the face: the reader produces આંખ, કાન, મોઢું and નાક with their genders (f, f, n, n), names આંખ and નાક as unbroken PIE cousins of eye and nose, states that મોઢું's nasalized -ũ is the same neuter tell carried by every -વું verb infinitive while નાક shows a neuter noun does not always carry it, and reaches back to વાંચવું's medial nasal and જવું/જોવું's one-mark contrast.

12.1 આંખ — an eye, and a nasal that is not what it looks like

બહેન closed a chapter about people. This chapter checks on how someone is — starting with the parts of the body a friend might actually ask about.

You'll want to know first — one word

આંખ — *āṅkh* — eye

The letters in this word

આ the independent long-*ā*, then the nasal dot ં sitting on top of it — exactly the medial anusvāra you first read inside વાંચવું, doing the same job here, in the middle of a noun rather than a verb — then ખ, the aspirated *k*. **Note**

what this nasal is NOT: it does not mark अि॒ as neuter — the word is feminine. A nasal dot in the middle of a word is a **sound**, present or absent as pronunciation happens to need it; it is a different thing entirely from the grammatical -*ũ* ending you will meet again soon, and this chapter keeps the two apart on purpose.

The word, taken apart — its roots and family

āṅkh is inherited from Sauraseni Prakrit *akkhi*, from Sanskrit **akṣi**, “eye.” The root is Indo-European **h₃ek^w-*, “eye; to see,” and it survives unbroken in English **eye** itself, in Latin *oculus* (behind **ocular**), and in Greek *ósse*. This is *bhāī*’s kind of cousin, not *bahen*’s: a straight line back to the same ancestor, no borrowing and no detour.

Your turn

- *Say it:* **āṅkh** — eye
- *Match:* the medial nasal here against the one in अि॒य॒
- *State:* is this nasal a gender marker? (No.) Is **āṅkh** neuter? (No — feminine.)
- *Trace it:* PIE *h₃ek^w-* → Sanskrit *akṣi* → अि॒य॒, and → English **eye**

Before you move on

Give the word for “eye.” (*Āṅkh.*) Which English word is the same word by unbroken descent? (**Eye.**) Does the nasal dot in *āṅkh* mean the word is neuter? (**No** — *āṅkh* is feminine; the dot is only a sound.) Sources: Wiktionary: अि॒य॒; Wiktionary: Sanskrit *akṣi*.

12.2 अि॒ — an ear whose own root is unsettled

अि॒ traced back cleanly to a confirmed Indo-European root. The next body part will not be nearly as tidy.

You’ll want to know first — one word

अि॒ — *kān* — ear

The letters in this word

ક ka, ા long-ā, ન na. All three already yours.

Grammar Lens: a gender that changed on the way here

કાન is feminine in Gujarati. Its Sanskrit ancestor, **karṇa**, was **masculine**. Nothing about inheriting a word guarantees its gender comes along unchanged — મિત્ર kept Sanskrit’s masculine, but *kān* did not keep *karṇa*’s. Gender, like the gender of આંખ or બહેન, has to be learned with each noun as it stands today, not projected backward from what its ancestor was — the same caution રોટલી’s chapter drew from its own -ī ending.

The word, taken apart — its roots and family

kān is inherited from Old Gujarati *kāna*, through Apabhramsa and Prakrit *kaṇṇa*, from Sanskrit **karṇa**, “ear.” Past that point, no agreement exists. Proposed origins include a root for “**defect**” (with “ear” as a later, narrower sense), a root meaning “**point**” or “**spike**,” a root meaning “**handle**” or “**grip**,” and a connection to *śṛṇoti*, “to hear.” None of these has won out. *Kān* joins *roṭlī* as a second word in your Gujarati vocabulary whose Sanskrit form is certain and whose deeper root is not — the honest answer, said plainly rather than picked at random.

Your turn

- *Say it:* **kān** — ear, and **āñkh** — eye
- *State:* *karṇa*’s Sanskrit gender against *kān*’s Gujarati gender (masculine → feminine)
- *Name:* two of the four disputed origins scholars have proposed for *karṇa*
- *Contrast:* *āñkh*’s confirmed PIE root against *kān*’s unsettled one

Before you move on

Give the word for “ear.” (*Kān*.) Did its gender change between Sanskrit and Gujarati? (**Yes** — masculine to feminine.) Is *karṇa*’s own root settled? (**No** — several proposals, no agreement.)

Sources: Wiktionary: **𑖦𑖩𑖫**; Wiktionary: Sanskrit karna.

12.3 𑖦𑖩𑖫 — the tell you have been hearing all along

𑖦𑖩𑖫's own gender shifted away from Sanskrit's. The next body part wears its gender in plain sight — the same nasalized ending you have heard on nearly every verb in this book.

You'll want to know first — one word

𑖦𑖩𑖫 — *moḍhũ* — **mouth**

The letters in this word

𑖦 *ma*, 𑖪 the *o* sign, then a new letter: 𑖫, the retroflex aspirated *dh* — curl the tongue back as for 𑖫 and 𑖫, and add the puff of breath that made 𑖫 aspirated. Then 𑖩, *u* with the nasal dot. *Mo-dhũ*.

Grammar Lens: the neuter tell, named plainly

Every verb infinitive in this book ends in the neuter -𑖫: *hovũ*, *javũ*, *jāṇvũ*, *lakhvũ* — a whole word class marked by that one nasalized ending. 𑖦𑖩𑖫 shows the same ending doing the same job on a **noun**: *moḍhũ* is **neuter**, and the nasalized -*ũ* is the single most recognizable tell for it. Not every neuter noun wears it — 𑖫𑖩𑖫 and 𑖫𑖩𑖫 do not — but when you do see or hear a word end this way, neuter is the way to bet. And do not confuse it with 𑖫𑖩𑖫's nasal: that one sat in the **middle** of a feminine word and marked nothing about gender at all. This one sits at the **end**, and it does.

The word, taken apart — its roots and family

moḍhũ is inherited from Sauraseni Prakrit **muha**, from Sanskrit **mukha**, “mouth, face.” It has a formal doublet, 𑖫𑖩 *mukh*, borrowed directly from the same Sanskrit word the way *kuṭumb* was — the everyday and the formal register, side by side, from one ancestor reached by two different roads. Past Sanskrit, *mukha*'s own root is not agreed upon — a second open question, alongside *karṇa*'s, rather than a guess dressed up as an answer.

Your turn

- *Say it:* **moḍhũ** — mouth
- *State:* what gender the -ũ ending marks, and one verb infinitive that wears the same ending
- *Contrast:* *moḍhũ*'s end-of-word nasal against *āṅkh*'s middle-of-word one
- *Name:* *moḍhũ*'s formal doublet, and how it reached Gujarati (borrowed whole, like *kuṭumb*)

Before you move on

Give the word for “mouth.” (*Moḍhũ.*) What gender does its -ũ ending mark? (**Neuter.**) Name the formal doublet of *moḍhũ*. (મુખ, *mukh.*)
Sources: Wiktionary: મૂં; Wiktionary: Sanskrit mukha.

12.4 નાક — the whole face, run back

આંખ, કાન, મોઢું — eye, ear, mouth. One more completes the face, and this one closes the chapter by tying its ending back to a pattern from three chapters ago.

You'll want to know first — one word

નાક — *nāk* — nose

The letters in this word

ના *na*, ા long-*ā*, ક *ka*. Every letter already familiar — *nāk*'s only new information is the word itself.

Grammar Lens: closing the chapter's gender count

નાક is neuter, like મોઢું — but unlike *moḍhũ*, it carries no nasalized -ũ at all. Run the whole face: *āṅkh* feminine, *kān* feminine, *moḍhũ* neuter with the tell, *nāk* neuter without it. Two neuters, only one of them wearing the ending that names the class. This is exactly why last lesson called the nasalized -ũ a **tell**, not a **rule**: it is the loudest signal Gujarati gives you for neuter, and it is still only sometimes there — the same caution

roṭlī and *pāṇī* already taught you about *-ī*, and *kān*'s Grammar Lens taught you about gender and inheritance more generally.

The word, taken apart — its roots and family

nāk is inherited from Prakrit **ṇakka**, from Sanskrit **nas**, “nose,” with a suffix added along the way — the retroflex **ṇ** here is the same sound-shift you first met turning *jānāti* into *jāṇvũ*, a single letter's worth of difference deciding a great deal, the way one mark once told *javũ* apart from *jovũ*. The root is Indo-European **nehas-*, unbroken in English **nose**, Latin *nāsus* (behind **nasal**), and Lithuanian *nósis*. Like *āṅkh*, *nāk* needed no ship and no loan to reach you — only the ordinary work of sound change, the same work that once put a nasal dot in the middle of **वियज्** and, this chapter, in the middle of **अिय**.

Your turn

- *Say it*: all four face words — **āṅkh**, **kān**, **moḍhũ**, **nāk**
- *Sort*: gender of each — feminine, feminine, neuter, neuter
- *State*: which of the two neuters carries the *-ũ* tell, and which does not
- *Trace it*: PIE *nehas-* → Sanskrit *nas* → **नस**, and → English **nose**
- *Recall*: the medial nasal in **वियज्**, and the one-mark contrast between **जज्** and **जिज्**

Before you move on

Give the word for “nose.” (*Nāk*.) Which English word is the same word by unbroken descent? (**Nose**.) Name this chapter's four body words and their genders. (*Āṅkh* f., *kān* f., *moḍhũ* n., *nāk* n.) Which neuter noun wears the nasalized *-ũ* tell, and which does not? (*Moḍhũ* does; *nāk* does not.)

Sources: Wiktionary: **नस**; Wiktionary: Sanskrit *nas*.

The Gujarati script — a reference

Not to be read before the lessons — they teach reading through real words.
This page gathers the system.

The three facts

1. **Consonants carry a built-in “a.”** ક ka, ન na, મા ma — written left to right. The shapes are Devanagari’s, minus one thing (see below).
2. **A vowel sign changes it.** કા kā, કિ ki, કી kī, કુ ku, કે ke, કો ko. The *i*-sign િ is written *before* the consonant but read *after* it. An *anusvāra* ં nasalises the vowel.
3. **A *virama* removes the vowel**, and the bare consonant joins the next as a conjunct: રા + ં + દ → રદ.

Worth flagging

- **No top line.** This is the one thing to remember. Devanagari, Bengali, and Gurmukhi hang their letters from a horizontal bar (the *shirorekha*); Gujarati cut it away, so its letters stand free. It is the fastest way to tell Gujarati from Hindi at a glance — “the headless script.”
- **The extra letter ળ (ḷ).** A **retroflex l**, tongue curled back — shared with Marathi and the Dravidian south, absent from Hindi. It appears in *maḷvū* (“to meet”).
- **Three genders.** Gujarati keeps Sanskrit’s masculine, feminine, *and* neuter (Hindi collapsed to two), marking gender on adjectives and possessives: *sāro* (m.) / *sārī* (f.) / *sārū* (n.).

Gujarati in the family

Gujarati is **Indo-Aryan** (from Sanskrit, like Hindi, Marathi, Punjabi, Bengali), spoken in Gujarat and across a large diaspora — the mother tongue of Mahatma Gandhi. Its Sanskrit core is shared with Hindi; its heavy **Perso-Arabic** layer (and a few Portuguese words from the coastal ports) is the mark of centuries as a great trading language across the Arabian Sea. The lessons trace both threads.
