Preface

This book teaches Bengali one word at a time, and it teaches each word by taking it apart. It is written for someone starting from zero — who may not read a single Bengali letter — so the script is taught *inside the word lessons themselves*: each word introduces exactly the letters it needs, so you learn to read নমস্কার *and* learn what it means in the same few minutes. (A reader who already reads Bengali simply skims the “letters in this word” notes.)

Bengali (*Bāṅglā*) is an **Indo-Aryan** language — descended, like Hindi, Marathi, and Punjabi, from Sanskrit — and the mother tongue of Bengal: West Bengal in India and all of Bangladesh, some 250 million speakers, the seventh-largest language on earth. It is the language of Tagore, and the only one to have furnished the national anthem of *two* nations. One habit runs through the whole book and is worth stating up front: Bengali’s inherent vowel is **ô** (not “a”), its *s* tilts to **sh**, and its *v* collapses to **b** — so Sanskrit *namaskāra* is spoken *nômoshkar*. Learn to hear that shift and every Sanskrit-derived word becomes legible. Roots are traced to Sanskrit and, where they reach, to the wider family that also gave English its words — every form supplied in full.

How to use this book

Every numbered section is one word, or one small phrase, and takes a few minutes — the length of a queue, an errand, or the walk to the bus. Read them in order the first time through: each section stands on the ones before it, and nothing is used before it has been taught. After that the book becomes reference, and you can open it anywhere.

Say the Bengali out loud wherever you can. The prompts under *Your turn* are written to be spoken, and saying a word is most of what makes it stay. The questions under *Before you move on* carry their own answers in brackets: cover them, answer from memory, then look.

Nothing here is gated behind the alphabet. Each lesson introduces exactly the letters and sounds its own word needs, so you are reading real words from the first page rather than drilling a chart. The whole script is gathered in a reference at the back of the book — somewhere to look things up when you are curious, never a chapter to sit through first.

Chapter 1

Greetings

Modes: ⇐ voice (1) 👁 eyes (5) ⇐ **Hands-free start:** all 6 lessons.

The Bengali greetings — and, taught through them, how to read the Bengali script and the one sound-shift that turns every Sanskrit word into something recognisably *Bengali*. Each lesson introduces the letters its word needs.

1.1 নমস্কার (*nômoshkar*) — “hello”

The letters in this word

(If you already read Bengali, skim this.) Bengali runs **left to right** under a top line, and every consonant carries a built-in vowel — but in Bengali that vowel is **ô** (an open “o”), *not* “a.” ন *nô*, ম *mô*, ক *kô*, র *rô*. A **vowel sign** changes it (াঁ *ā*); a *hasanta* under ঞ strips the vowel so it joins the next as a conjunct: ঞ + ক → ঞ্ক.

The word, taken apart — its roots and family

নমস্কার is the *same word* as the Sanskrit *namaskāra* behind Hindi’s and Marathi’s greeting (*namas* “a bow” + *kāra* “the making of”) — but listen to what Bengali does to it. The inherent “a” becomes **ô**, and *s* shifts to **sh**, so the written *namaskāra* is *spoken* **nômoshkar**. That one habit — *a*→*ô*, *s*→*sh* — is the fingerprint of Bengali, and once you hear it you can un-shift almost any word back to its Sanskrit cousin.

Why it's said this way

Nômoshkar, palms together, is the everyday respectful greeting among Bengali Hindus and in formal speech generally — hello and, often, goodbye. Bengali Muslims more often exchange *as-salāmu alaikum* / *nāmāskār* by community; *nômoshkar* is the broad, secular-to-Hindu default. Bengali is the language of Tagore — the only tongue to have written the national anthem of *two* countries, India and Bangladesh.

1.2 ধন্যবাদ (*dhônyobād*) — “thank you”

The letters in this word

New: ধ *dhô* (breathy *d*), ব *bô*, দ *dô*, and the conjunct ন্য (ন + য *y*).
With the া sign, read ধন্যবাদ as *dhô · nyo · bā · d*.

The word, taken apart — its roots and family

ধন্যবাদ is Sanskrit *dhanya* (“worthy”) + *vāda* (“a saying”) — the very “thank you” Hindi (*dhanyavād*), Marathi, and Punjabi use. Two Bengali quirks show at once: the inherent *a*→*ô* again (*dhônyobād*), and **no separate “v”** — Bengali has only ব, so Sanskrit *vāda* is spoken *bād*. *V* becoming *b* is a Bengali signature (think of *Bishnu* for *Vishnu*).

1.3 হ্যাঁ / না (*hyā / nā*) — “yes” and “no”

The letters in this word

New: হ *hô*, the *y-phola* াঁ that glides the sound, and the nasal mark *chandrabinḍu* ং (a moon-with-dot) that sends the vowel through the nose. না is simply ন + া *nā*.

The word, taken apart — its roots and family

হ্যাঁ (*hyā*, “yes”) and না (*nā*, “no”). That “no” rides the ancient negative *na-* — the same Proto-Indo-European **ne* behind English **no**, **not**, **none**, Latin *nōn*, and Hindi *nahīn*. Bengali kept it at its shortest, bare *nā*: the family resemblance to English *no* is right on the surface.

1.4 আচ্ছা (*āchchhā*) — “okay / I see”

The letters in this word

New: আ — the **independent** vowel *ā*, the shape a word uses when it *starts* with a vowel (a built-in vowel rides a consonant; a standalone one gets its own letter). Then the doubled ছ (চ *ch* + ছ *chh*). Read আচ্ছা as *ā · chchhā*.

The word, taken apart — its roots and family

আচ্ছা (*āchchhā*) is the all-purpose “okay, alright, I see, go on” — a true workhorse of spoken Bengali, from Sanskrit *acchā* (“good, clear”). It is the little word that keeps a conversation moving; a Bengali speaker will pepper speech with *āchchhā*... *āchchhā* the way an English speaker says “right... right.”

1.5 আসি (*āshi*) — “I’ll be going” (goodbye)

The letters in this word

New: স again — here truly “sh” — and the ি sign (*i*), which in Bengali is *written before* the consonant it follows but *read after* it. আসি = আ + সি, *ā-shi*.

The word, taken apart — its roots and family

আসি (*āshi*) literally means “**I come**” — from the verb *āsā* (“to come,” Sanskrit root shared with Hindi *ānā*). Yet it is how Bengalis say *goodbye*. Never “I’m leaving” (unlucky, too final) but “I’ll come [again]” — আসি or the fuller *āschhi* (“I am coming”). It is the very same “promise of return” farewell Tamil and Marathi reach for: a whole culture’s optimism folded into one verb.

Grammar Lens

Notice Bengali marks no gender on the verb — *āshi* is “I come” whether a man or a woman says it. That sets it apart from Marathi (*yeto* m./*yete* f.) and Hindi, and makes Bengali verbs, in this one respect, simpler than its neighbours’.

1.6 Recap

Bengali		Meaning
নমস্কার	<i>nômoshkar</i>	hello / goodbye
ধন্যবাদ	<i>dhônyobād</i>	thank you
হ্যাঁ / না	<i>hyā / nā</i>	yes / no
আচ্ছা	<i>āchchhā</i>	okay / I see
আসি	<i>āshi</i>	goodbye (“I’ll come again”)

One habit unlocks this whole chapter: Bengali’s inherent vowel is **ô**, not “a,” and its *s* leans toward **sh** while its *v* collapses to **b**. Hear those shifts and the “foreign” *nômoshkar* and *dhônyobād* snap back into the Sanskrit *namaskāra* and *dhanyavāda* you already knew. Next chapter: introducing yourself — *āmār nām...* (“my name...”) — and Bengali’s *tumi* / *āpni* (familiar / respectful “you”).

Chapter 2

Introducing Yourself

Modes: 🗣️ **voice** (2) 👁️ **eyes** (6) 🖐️ **Hands-free start:** first 2 of 8 lessons.

Now a first real exchange — giving your name, asking for someone else’s, and saying you’re glad to meet them:

আমার নাম মির। (*āmār nām Mira* — “My name is Mira.”)
তোমার নাম কি? (*tomār nām ki* — “What is your name?”)

Built the same way as the greetings — each piece taken apart, its letters and root, then assembled.

2.1 নাম (*nām*) — “name,” a word older than Europe

The letters in this word

ন (*nô*) + া̃ (long ā, overriding the inherent ô) + ম (*mô*) → নাম (*nām*).

The word, taken apart — its roots and family

নাম (*nām*) ← Sanskrit *nāman*, from Proto-Indo-European **h₃nómn*.
— the *same* root as English **name**, Latin *nōmen* (English **noun**), and Greek *onoma*. Bengali *nām* and English *name* are cousins from before either language existed.

2.2 আমার (āmār) — “my”

The word, taken apart — its roots and family

আমার (āmār, “my”) is the possessive of আমি (āmi, “I”), on the first-person stem *ām-* ← Sanskrit *asmad*. Buried in it is the same ancient **m-** of English **me**, **my**, **mine** and Latin *mē*.

Grammar Lens

No gender here. *āmār* never changes for gender, where Hindi and Punjabi have *merā* (m.) / *merī* (f.). Bengali threw grammatical gender away entirely — one of its great simplifications, which you will meet again and again.

2.3 আমার নাম... (āmār nām ...) — “my name is...,” with no “is”

আমার (my) + নাম (name) + name = “my name ...” → “my name is...” *Āmār nām Arun*.

Grammar Lens

Bengali drops “is” in the present. There is *no verb*: Bengali sets “my name” beside “Arun” and the “is” is understood. This is the **zero copula** — for present-tense equations (X is Y), Bengali needs no “to be” (like Tamil, and unlike Hindi’s *merā nām ...hai*). A verb returns only for a *state* or *place* (Chapter 3).

2.4 তুমি / আপনি (tumi / āpni) — “you,” three ways

The word, taken apart — its roots and family

তুমি (*tumi*, familiar “you”) ← Sanskrit *tvam*, from PIE **tū* — the same root as English archaic **thou**, Latin *tū*. Bengali grades respect in **three**: তুই (*tui*, intimate), তুমি (*tumi*, familiar), আপনি (*āpni*, respectful) — like Hindi’s *tū/tum/āp*. For a first meeting, *āpni*.

2.5 কি (*ki*) — “what”

The word, taken apart — its roots and family

কি (*ki*, “what”) ← the interrogative stem *ka-*, PIE **k^wo-* — the root behind English **wh-** and Latin *qu-*. Bengali’s questions nearly all begin with *k-*: *ki* (what), *ke* (who), *kôbe* (when), *kôthāy* (where), *kēmon* (how).

2.6 তোমার নাম কি? (*tomār nām ki*) — “what’s your name?”

তোমার (*tomār*, “your,” from *tumi*) + নাম (name) + কি (what) = “**your name what?**” — still *no “is.”* The respectful “your” is আপনার (*āpnār*, from *āpnī*): *āpnār nām ki?* — the one for a stranger.

2.7 আলাপ করে ভালো লাগলো (*ālāp kore bhālo lāglo*) — “pleased to meet you”

The word, taken apart — its roots and family

আলাপ করে ভালো লাগলো — “having made [your] acquaintance, it felt good.” The key word আলাপ (*ālāp*, “acquaintance, conversation”) is **Sanskrit** (*ālāpa*, *ā-* “toward” + *lap* “to speak”) — the same *ālāp* that names the slow, exploratory opening of a *rāga*, where a musician “converses” with the notes.

2.8 The whole exchange

Bengali	English
আমার নাম মির।	My name is Mira.
আপনার নাম কি?	What’s your name?
আমার নাম অরুণ।	My name is Arun.
আলাপ করে ভালো লাগলো।	Pleased to meet you.

Every atom traced: *nām* (Sanskrit *nāman*, English *name*), *āmār* (first-person *ām-*, no gender), *ki* (root *ka-*, English *what*), *ālāp* (Sanskrit “con-

versing”). Two Bengali habits already: the **zero copula** (no “is”), and **no grammatical gender**. Next chapter: *tumi kēmon āchho?* (“how are you?”).

Chapter 3

How Are You?

Modes: ⇄ voice (1) 👁 eyes (5) ⇄ **Hands-free start:** all 6 lessons.

After the name comes the exchange everyone actually has — and, for the first time, Bengali brings back a verb “to be”:

তুমি কেমন আছো? (*tumi kēmon āchho* — “How are you?”)
আমি ভালো আছি, ধন্যবাদ। (*āmi bhālo āchhi, dhônnobad* — “I’m well, thank you.”)

3.1 কেমন (*kēmon*) — “how,” another of the k-questions

The word, taken apart — its roots and family

কেমন (*kēmon*, “how, of what kind”) is from the interrogative stem *ka-*, PIE **k^w**o-* — the root behind English **wh-** and Latin *qu-*. Bengali’s questions nearly all begin with *k-*: *ki*, *ke*, *kôbe*, *kôthāy*, *kēmon*.

3.2 তুমি কেমন আছো? — “how are you?”

The new word is আছো (*āchho*, “are you”), from the verb আছা (*āchhā*, “to be, exist, have”) + the familiar-you ending. So তুমি কেমন আছো? is “you how are?”, the verb last. Respectful: আপনি কেমন আছেন? (*āpni kēmon āchhen?*).

Grammar Lens

Now the copula returns. Chapter 2’s zero copula covers *equations* (*āmār nām Arun*). But “how are you?” asks about a *state* — how you *exist* — and for that Bengali uses a real verb, **আছি** (*āchhā*). No verb for “my name is Arun”; a real verb for “how are you.”

3.3 আমি (*āmi*) — “I,” cousin of English *am*

The word, taken apart — its roots and family

আমি (*āmi*, “I”) descends from Sanskrit **अस्मि** (*asmi*, “I am”), from PIE **h₁es-* — the “to be” root that gives English **am** and Latin *sum*. So Bengali’s word for “I” is, at the root, a form of “**am**”: “I” and “am” were once one word. Its possessive is *āmār* (“my”).

3.4 ভালো (*bhālo*) — “well,” and how to answer

The word, taken apart — its roots and family

ভালো (*bhālo*, “good, well, fine”) is the everyday Bengali “good,” likely from Sanskrit **ভদ্র** (*bhadra*, “good, auspicious”). It fills the language: *bhālo lāge* (“[I] like it”), *bhālobāsā* (“love,” literally “good-dwelling”). The reply: আমি ভালো আছি (*āmi bhālo āchhi*), “I am well.”

3.5 কোনো ব্যাপার না (*kono bāpār nā*) — “no matter”

The word, taken apart — its roots and family

কোনো ব্যাপার না literally “[it’s] **no matter**” — *kono* (“any”) + ব্যাপার (*bāpār*, “matter, affair”) + না (*nā*, “not”). It serves as “it’s nothing / you’re welcome.” *Bāpār* is **Sanskrit** (*vyāpāra*, “dealing”), and *nā* you met in Chapter 1 — the ancient negative, PIE **ne*, behind English **no**, **not**, **none**.

3.6 The whole exchange

Bengali	English
তুমি কেমন আছো?	How are you?
আমি ভালো আছি, ধন্যবাদ।	I'm well, thank you.
কোনো ব্যাপার না।	No matter / you're welcome.

Every atom traced: *kēmon* (the *k*- questions), *āmi* (Sanskrit *asmi*, English *am*), *bhālo* (Sanskrit *bhadra*), *nā* (PIE *ne, English *no*). Next chapter: the farewells.

Chapter 4

Farewells

Modes: ⇐ voice (2) 👁 eyes (3) ⇐ Hands-free start: all 5 lessons.

Chapter 1 gave you the tender আসি (*āshi*, “I’ll come [again]”). Its fuller, everyday form:

আবার দেখা হবে! (*ābār dækhā hōbe* — “We’ll meet again!”)

4.1 আবার (*ābār*) — “again”

The word, taken apart — its roots and family

আবার (*ābār*, “again”) is a native Indo-Aryan adverb with no tidy English cognate, but a familiar job: it turns a parting into a promise. Add it to Chapter 1’s *āshi* and you can say “we’ll meet *again*.”

4.2 দেখা হবে (*dækhā hōbe*) — “(we) will meet”

The word, taken apart — its roots and family

দেখা হবে literally “[a] seeing will happen” — দেখা (*dækhā*, “seeing,” from *dækhā* “to see”) + হবে (*hōbe*, “will be/happen,” future of *hōwā* “to be/become”). Bengali says “a meeting will occur” rather than “we will meet” — an impersonal, gentle promise of reunion.

Grammar Lens

The impersonal future. Many “we’ll...” expressions use **noun** + *hōbe* (“...will happen”): *dækhā hōbe* (“a seeing will happen”), *kôthā*

hôbe (“a talk will happen”). The event itself is the subject — no “we.”

4.3 আবার দেখা হবে (*ābār dækhā hôbe*) — “we’ll meet again”

আবার (again) + দেখা হবে (a seeing will happen) = “**we’ll meet again.**” It is the warm, explicit form of Chapter 1’s *āshi* — the subcontinent’s “promise of return” (Hindi *phir milenge*, Tamil *pōy varugirēṇ*), never a blunt “goodbye.”

4.4 কাল দেখা হবে (*kāl dækhā hôbe*) — “see you tomorrow”

The word, taken apart — its roots and family

কাল (*kāl*) means **both “tomorrow” and “yesterday”** — the day on either side of today — from Sanskrit *kāla* (“time”), the very root behind Hindi’s *kal* and Punjabi’s *akāl* (“timeless”). The verb’s tense tells which: *kāl dækhā hôbe* (future → “tomorrow”). So the phrase is “tomorrow, a seeing will happen.”

4.5 The farewells

Bengali	English
আসি।	I’ll come [again]. (Ch.1 goodbye)
আবার দেখা হবে।	We’ll meet again.
কাল দেখা হবে।	See you tomorrow.

Roots banked: *dækhā hôbe* (the impersonal “a seeing will happen”), *kāl* (*kāla* “time,” cousin of Hindi *kal*, Punjabi *akāl*). Next chapter: the first real verbs — *āmi bānglā bôli* — and Bengali’s total lack of gender.

Chapter 5

The First Verbs

Modes: ⇄ voice (1) 👁 eyes (4) ⇄ Hands-free start: all 5 lessons.

Until now, “to be.” Now verbs that *act* — and the gloriously simple way Bengali conjugates them:

আমি বাংলা বলি। (*āmi bānglā bôli* — “I speak Bengali.”)

5.1 বলা (*bôlā*) — “to speak,” your first full verb

The word, taken apart — its roots and family

বলা (*bôlā*, “to speak, say”) is a native Indo-Aryan verb (the same *bol-* as Hindi *bolnā*, Punjabi *bolṇā*). The ending -আ (*-ā*) is the infinitive; add -ই (*-i*) to the stem for “I speak”: *bôl-* + *-i* → বলি (*bôli*).

Grammar Lens

The verb changes for person — but *never* for gender. *āmi bôli* (I say), *tumi bôlo* (you say), *se bôle* (he/she says). There is no “he-form” vs. “she-form”: *se bôle* is “he says” *and* “she says.” Where Hindi and Punjabi make even “I speak” agree with the speaker’s gender (*boltā/boltī*), Bengali dropped grammatical gender entirely — one less thing to track, forever.

5.2 আমি বাংলা বলি — “I speak Bengali”

আমি (I) + বাংলা (*bānglā*, the object) + বলি (speak) — “I Bengali speak,” verb last. The name বাংলা (*bānglā*) is the language’s own word for itself

(English “Bengali” comes from it), descending from বঙ্গ (*bôngo*), the ancient name of the region — so the language is named after its land, the great delta of the Ganges.

Grammar Lens

Because Bengali verbs carry no gender, this sentence is the *same* whether a man or a woman says it — unlike Hindi. And since *-i* already means “I,” you could drop *āmi*: *bānglā bôli* is a complete “I speak Bengali.”

5.3 থাকা (*thākā*) — “to live, to stay”

The word, taken apart — its roots and family

থাকা (*thākā*, “to live, stay, remain”) is from Sanskrit স্থা (*sthā*, “to stand, stay”), the PIE root **steh₂-* that also gives English **stand**, **stay**, **state** and Latin *stāre*. “I live in Kolkata” is আমি কলকাতায় থাকি (*āmi Kolkātāy thāki*) — stem + the *-i* “I,” no gender.

Grammar Lens

“In” comes after the noun. কলকাতায় (*Kolkātāy*) = *Kolkata* + *-y* (“in, at”), on the noun’s *end*. Bengali uses **postpositions** where English uses prepositions.

5.4 কাজ করা (*kāj kôrā*) — “to work”

The word, taken apart — its roots and family

করা (*kôrā*, “to do, make”) is from Sanskrit *kr* (“to do”), PIE **kʷer-* — the root of Chapter 1’s *nômoshkar* (*namas* + *kāra*, “the making of a bow”) and of *karma*. And কাজ (*kāj*, “work”) is itself from Sanskrit *kārya* (also from *kr*). Bengali builds compounds as **noun** + করা: কাজ করা (*kāj kôrā*, “work-do” = “to work”). So *āmi kāj kôri* = “I work.”

5.5 Sentences about yourself

Bengali	English
আমি বাংলা বলি।	I speak Bengali.
আমি কলকাতায় থাকি।	I live in Kolkata.
আমি কাজ করি।	I work.

Three verbs, one gender-free engine: the *-i* “I” ending, the verb always last, and **never** a change for gender. Roots banked: *bôlā* (native), *thākā* (*sthā* → English *stand/stay*), *kôrā* (*kr* — root of *nômoshkar*; *kāj* “work” ← *kārya*), and *bānglā* (*bôngo*, the Ganges delta). From here, Bengali’s sentences only grow.

Chapter 6

Numbers One to Five

Modes: 🗣️ voice (1) 🗣️ Hands-free start: all 1 lesson.

By the end of this chapter: I can count from one to five in Bengali script and say what দুই kept that Hindi and Marathi flattened away.

Count ek, dui, tin, chār, pāch aloud, name the chandrabindu riding পাঁচ, and set দুই beside Hindi do and Marathi don to show the -i it preserved.

6.1 এক, দুই, তিন, চার, পাঁচ — one to five

Bengali writes in its own script, but the words underneath are the same family you'd hear in Delhi or Mumbai — with one number that preserves something both of them lost.

You'll want to know: the five

	Bengali	said
1	এক	<i>ek</i>
2	দুই	<i>dui</i>
3	তিন	<i>tin</i>
4	চার	<i>chār</i>
5	পাঁচ	<i>pāch</i>

The ঞ on *pāch* is the **chandrabindu**, the same moon-dot Hindi uses, nasalising the vowel.

The word, taken apart — its roots and family

language	2
Sanskrit	stem <i>dvá-</i> (masc. <i>dváu</i> , fem./neut. <i>dvé</i>)
Prakrit	<i>do</i> / <i>duve</i>
Hindi	<i>do</i>
Marathi	<i>don</i>
Bengali	<i>dui</i>

Hindi and Marathi flattened the old form into a single *o*. Bengali kept a trace of the following **-i**, which is why it has two syllables where its neighbours have one.

The *dv-* cluster itself is gone from the **numeral** in all of them. (Not from the languages — *dv-* is alive in words borrowed straight back out of Sanskrit, like Bengali দ্বার *dvār* “door.” It’s the everyday inherited word that simplified.)

And Bengali isn’t unique in keeping that vowel: **Assamese, Odia and Nepali** have *dui* too. Among the four languages in this chapter it stands alone; across the eastern Indo-Aryan languages it has plenty of company.

The letters in this word

Bengali’s inherent vowel leans toward **o**, not *a* — which is why the greeting from Chapter 1 is *nomoshkar* where Hindi says *namaskār*. You won’t hear that in these five numbers, as it happens: এক opens with the independent vowel ঐ, and none of the others has a bare inherent-vowel syllable either. Mentioned so you don’t go looking for it here — but keep it in mind the moment a word does have one. Don’t let a neighbouring language’s spelling tell you how Bengali sounds.

Your turn

Say these aloud:

- “ek, dui, tin, chār, pāch”
- the twos — “dvá- ... do ... don ... **dui**”
- the Ch. 1 echo — “**nomoshkar**, not **namaskār**”

Before you move on

Count to five in Bengali. (*Ek, dui, tin, chār, pāch.*) What does ঐ keep that Hindi and Marathi flattened away? (**The following -i**, which is why it has two syllables.) Is Bengali alone in that? (**No** — Assamese, Odia and Nepali have *dui* too; it's alone only among the four here.) Did the *dv*- cluster survive anywhere in the everyday numeral? (**No** — though *dv*- is alive in words re-borrowed from Sanskrit, like *dvār* “door”.) What is the ঙ? (The **chandrabindu**, nasalising the vowel.) Next: six to ten.

Chapter 7

The Core Verbs

Modes: ⇄ voice (6) ⇄ Hands-free start: all 6 lessons.

By the end of this chapter: I can say what I do with six everyday Bengali verbs, pick the ending that matches তুই, তুমি or আপনি, and say why a Bengali verb never changes for gender and why আছে has to hand the future to হবে.

Say *āmi jāni* and *āmi tāke chini*, separate জানা from চেনা the way French separates *savoir* from *connaître*, hear the vowel harmony that closes *chini* where *chæne* stays open, and run the chapter’s six verbs back — *hōwā*, *jāwā*, *āsā*, *khāwā*, *dækhā*, *jānā*.

7.1 হওয়া (hōwā) — “to be,” and the be-verb it stands beside

Chapter 2 said “my name Arun” with no verb at all. Chapter 3 put one back for “how are you.” Both were right, and this verb is why.

You’ll want to know: হওয়া

হওয়া — *hōwā* — to be, to become

আমি হই (*āmi hōi*), “I am, I become.” সে হয় (*se hōy*), “he is.” Its future is already in your mouth: হবে (*hōbe*) is the “will happen” inside Chapter 4’s *dækhā hōbe*.

The word, taken apart — its roots and family

হওয়া is Sanskrit $\sqrt{\text{bhū}}$ ($\sqrt{\text{bhū}}$, “to become”) with the *bh-* worn down to a plain *h-*: *bhavati* → Prakrit *hoī* → Bengali *hō-*. The root is PIE $*b^h_uH-$, “to grow, to become,” and English owns two of its children outright — **be** and **been**. Latin built *fuī* (“I was”) and *futūrus* on it, which is English **future**; Greek built *phúsis*, “growth, nature,” which is **physics**.

The letters in this word

হ is a soft, breathed *h* carrying Bengali’s inherent vowel — *hō*, not *ha*. ওয়া (*-wā*) is the tail every dictionary-form verb wears; you will meet it again on খাওয়া and যাওয়া.

Grammar Lens: two be-verbs, and one of them is unfinished

what you mean	what Bengali uses
my name is Arun	no verb at all
I have a book; it is here	আছে (<i>āchhe</i>)
he will be a teacher	হবে (<i>hōbe</i>)

আছ-, the verb behind Chapter 3’s *kemon āchho*, means **being present**. But it is unfinished: it has a present and a past, and nothing else at all. Push it into the future and it stops dead — so Bengali picks up হ- (*hōbe*), or Chapter 5’s থাকা (*āmi thākbo*, “I’ll be there”). One job, two verbs, split down the middle.

Your turn

Say these aloud:

- “hōwā” — be, become — then “āmi hōi”
- the future you already knew — “hōbe ... dākhā hōbe”
- which verb for “I have a book,” and which for “he will be a teacher”

Before you move on

Which Sanskrit root is *hōwā*, and which two English words are its brothers? ($\sqrt{\text{bhū}}$, “to become” — **be** and **been**.) What can আছ-

not do? (**Anything past a present and a past** — it has no future of its own.) So what does Bengali reach for instead? (হবে, or থাকা.) Next: one verb, three levels of respect.

7.2 যাওয়া (jāwā) — “to go,” and the respect that rides on the ending

Chapter 2 gave you three different words for “you.” It did not tell you the rest of the bill: each one bends the verb a different way too.

You’ll want to know: যাওয়া

যাওয়া — *jāwā* — to go

আমি যাই (*āmi jāi*), “I go.” Same *-i* “I” ending as Chapter 5’s *bôli*, on the same *-wā* dictionary form you met a moment ago.

The word, taken apart — its roots and family

যাওয়া is Sanskrit $\sqrt{\text{या}}$ (*yā*, “to go, to travel”), and the whole northern family walks on it: Hindi *jānā*, Marathi *jāne*, Gujarati *javũ*, Punjabi *jāṇā*. Sanskrit’s *y*-hardened to a *j*-sound right across eastern Indo-Aryan, which is why Bengali still writes the *y*-letter য but says *j*. Deeper than Sanskrit it goes to PIE **yeh₂-*, “to travel” — and here is an honest limit: English kept **no** everyday word from that root. The nearest living cousin is Lithuanian *jóti*, “to ride.” A fake English cousin here would be worse than none.

The letters in this word

য is the letter Sanskrit reads as *y*; Bengali reads it as *j*, like জ. So a written *yā-* is a spoken *jā-* — an un-shift worth keeping, since it disguises dozens of familiar Sanskrit words.

Grammar Lens: the respect is not in the pronoun, it is in the ending

who you are speaking to	“you go”
তুই (<i>tui</i> , intimate)	যাস (<i>jāsh</i>)
তুমি (<i>tumi</i> , familiar)	যাও (<i>jāo</i>)
আপনি (<i>āpni</i> , respectful)	যান (<i>jān</i>)

Three endings, one verb. And the same grading runs on into the third person: সে যায় (*se jāy*) is “he goes,” তিনি যান (*tini jān*) is “he goes” said of someone you respect — the very ending আপনি takes. Chapter 5 showed that the ending already means “I,” so the pronoun can be dropped. The register cannot. Choose *jāsh* or *jān* and you have placed yourself socially, pronoun or no pronoun.

Your turn

Say these aloud:

- “jāwā” — go — then “āmi jāi”
- the ladder — “jāsh ... jāo ... jān”
- the two third persons — “se jāy ... tini jān”

Before you move on

Give the three “you go” forms and who each is for. (*Jāsh* intimate, *jāo* familiar, *jān* respectful.) If you drop the pronoun, is the respect dropped too? (**No** — it is in the ending, and cannot be dodged.) Does English have a living cousin of this root? (**No** — Lithuanian *jóti* is as close as it gets.) Next: the verb that asks nothing about who you are.

7.3 আসা (*āsā*) — “to come,” the verb that never asks who you are

Chapter 1’s goodbye, *āshi*, was one form of this verb. Here is the whole of it — and the one question it refuses to ask you.

You'll want to know: আসা

আসা — *āsā* — to come

আমি আসি (*āmi āsi*), “I come” — the farewell you already own. সে আসে (*se āse*), “he comes.” আপনি আসেন (*āpni āsen*), with last lesson’s respectful ending.

The word, taken apart — its roots and family

The আ- in front is Sanskrit’s *ā-*, “hither, toward” — the very prefix that turns going into coming. Hindi’s *ānā* is that *ā-* welded onto *yā-*, the go-verb of the last lesson: “go, but this way.” Bengali shows the same prefix on a different stem, and the honest position on that stem is that its history is unsettled; this book will not invent one for it.

The letters in this word

স is written for *s* and spoken, in this word, as *sh* — Bengali’s standing *s* → *sh* tilt, the same one that makes *namaskāra* into *nômoshkar*. So আসি is *āshī*, not *āsi*, though the dictionary form is romanized *āsā*.

Grammar Lens: no gender, not here, not anywhere

language	“I come,” man / woman
Hindi	<i>maini ātā hūmī</i> / <i>maini ātī hūmī</i>
Marathi	<i>mā yeto</i> / <i>mā yete</i>
Bengali	<i>āmi āsi</i> — one form

Its sisters make you declare your gender to say the plainest thing in the world. Bengali does not. And this is not a shortcut for beginners that the grammar takes back later: **Bengali has no grammatical gender at all**. Not on verbs, not on nouns, not on adjectives. The past behaves the same way — আমি এলাম (*āmi elām*), “I came,” is one form for everyone, where Gujarati, which hides gender in its present, brings it straight back in *humī āvyo* / *humī āvī*.

Your turn

Say these aloud:

- “*āsā*” — come — then “*āmi āshī*”

- the neighbours splitting in two — “ātā ... ātī” and “yeto ... yete”
- Bengali not splitting — “āmi āsi” — and its past, “āmi elām”

Before you move on

What does the আ- on this verb mean, and where else have you met it? (**Hither, toward** — it is the ā- inside Hindi’s ānā.) How many forms of “I come” does a Bengali speaker need? (**One** — āmi āsi, whoever is talking.) Is that true of the nouns too? (**Yes** — Bengali has no grammatical gender anywhere.) Next: a verb that swallows more than food.

7.4 খাওয়া (khāwā) — “to eat,” and the drinking it also does

Every verb so far has meant roughly what its English gloss means. This one is wider than its gloss, and the extra width is the lesson.

You’ll want to know: খাওয়া

খাওয়া — khāwā — to eat

আমি খাই (āmi khāi), “I eat.” আপনি খান (āpni khān), with the respectful ending from two lessons back.

The word, taken apart — its roots and family

খাওয়া is Sanskrit √खाद् (√khād, “to chew, to bite”), smoothed through Prakrit khā-. Every neighbour eats with it: Hindi khānā, Marathi khāne, Gujarati khāvũ, Punjabi khāṇā.

Past Sanskrit the trail goes cold. Khād- has no secure Indo-European pedigree outside Indo-Aryan, so there is no English cousin here — and one will not be manufactured. Some roots are simply local, and saying so is part of the method.

The letters in this word

খ is kh: a k with a puff of breath behind it. Its plain partner ক (k) is the letter in Chapter 5’s kāj. The puff is not decoration — it is the

whole difference between two words, and Bengali gives each its own letter.

Grammar Lens: Bengali eats its drinks

Bengali	what it means
জল খাওয়া (<i>jôl khāwā</i>)	to drink water — “water-eat”
চা খাওয়া (<i>chā khāwā</i>)	to drink tea
ওষুধ খাওয়া (<i>oshudh khāwā</i>)	to take medicine

Hindi keeps a second verb, *pīnā*, for drinking. Bengali’s everyday speech does not bother: whatever goes in the mouth is *khāwā*. There is a drink-verb — পান করা (*pān kôrā*), noun-plus-*kôrā* in exactly Chapter 5’s *kāj kôrā* shape, built on Sanskrit √पा (*√pā*, “to drink”), whose Latin cousin *pōtāre* gives English **potion** and **potable**. But it belongs to writing and ceremony. Ask for tea in a Kolkata kitchen and you eat it.

Your turn

Say these aloud:

- “khāwā” — eat — then “āmi khāi”
- the drinking Bengali eats — “jôl khāwā ... chā khāwā”
- the formal drink-verb and its English cousins — “pān kôrā ... potion, potable”

Before you move on

How do you say “drink water” in everyday Bengali? (জল খাওয়া — literally “water-eat.”) Which Sanskrit root is *khāwā*, and does English share it? (√*khād*, “to chew” — and **no**, the root goes no further than Indo-Aryan.) Which verb would a formal text use for drinking, and what English words does its root reach? (পান করা, from √*pā* — English *potion*, *potable*.) Next: one spelling, two vowels.

7.5 দেখা (dækhā) — “to see,” and a vowel that moves under a fixed spelling

Chapter 4 buried this verb inside *dækhā hōbe*, “a seeing will happen.” Prised out on its own, it carries a sound rule that runs through every verb in this chapter.

You’ll want to know: দেখা

দেখা — *dækhā* — to see, to look

আমি দেখি (*āmi dekhi*), “I see.” সে দেখে (*se dækhe*), “he sees.” Read those two romanizations again — they are not the same vowel.

The word, taken apart — its roots and family

দেখা is traced to Sanskrit √दृश् (*√dṛś*, “to see”) through the Prakrit stem *dekkha-*; Hindi’s *dekhnā* is the same word. Sanskrit built *darśana*, “a viewing,” on that root, and further back it is PIE **derk-*, “to see clearly.” Greek took it for *dérkomai*, “I look,” and for *drákōn*, the sharp-gazing serpent — which English borrowed as **dragon**. Bengali’s “see” and England’s dragons are one word, wearing very different clothes.

The letters in this word

দ is a soft dental *d*, tongue on the teeth. The vowel sign ে on it is written identically every time — but Bengali says it either as a close *e* (as in English *bay*) or an open *æ* (as in English *bat*), and the page will never tell you which.

Grammar Lens: the ending decides the vowel

Bengali	said
আমি দেখি	<i>dekhi</i> — close <i>e</i>
সে দেখে	<i>dækhe</i> — open <i>æ</i>
তুমি দেখো	<i>dækho</i> — open <i>æ</i>

The rule: when the ending carries the high vowel *-i*, the stem vowel closes to *e*. Any other ending leaves it open at *æ*. That is **vowel harmony**, and the verb of the first lesson does it too — আমি হই (*hôi*, closed) against সে হয় (*hôy*, open). It is a rule your ear must carry

alone, because the spelling never budes.

Your turn

Say these aloud:

- “dækhā” — then the pair, “dekhi ... dækhe”
- the same shift on the be-verb — “hôi ... hōy”
- the root and its odd English relative — “ḍṛś ... dragon”

Before you move on

Which ending closes the stem vowel to *e*? (**The -i of “I”** — *dekhi*, against *dækhe* and *dækho*.) Does the spelling record that? (**No** — **দে** is written the same either way; only the ear knows.) Which English animal shares this verb’s root? (**The dragon** — Greek *drákōn*, from PIE **derǵ-*.) Next: the last verb, and the knowing English lost.

7.6 জানা (jānā) — “to know,” and the knowing English gave up

Six thousand years ago this verb and the English word you are reading it with were the same word. They still are. But Bengali kept a distinction English threw away.

You’ll want to know: জানা

জানা — *jānā* — to know

আমি জানি (*āmi jāni*), “I know.” আপনি জানেন (*āpni jānen*), respectfully.

The word, taken apart — its roots and family

জানা is Sanskrit $\sqrt{\text{জ্ঞ}}$ (*√jñā*, “to know”), the root under *jñāna*, “knowledge.” Behind it stands PIE **ǵneh₃-*, and English is full of its children: **know** and **knowledge** by the direct Germanic road; **notice**, **recognize** and **cognition** through Latin *nōscere*; **gnosis** and **diagnosis** through Greek *gignōskein*. Bengali *jāni* and English *know* are one verb, separated only by time.

The letters in this word

Sanskrit writes the root with ज्ञ, a knot of *j* and *ñ*. Bengali does not say *jñ* at all — it says **gg**, so *jñāna* comes out *ggān*. The plain verb spares you the knot: জানা is simply জা + না, *jā-nā*.

Grammar Lens: two knowings, and English has one word for both

Bengali	what it knows
জানা (<i>jānā</i>)	a fact, or how to do something
চেনা (<i>chenā</i>)	a person or a place, by acquaintance

আমি জানি — “I know” (that it is so). আমি তাকে চিনি (*āmi tāke chini*) — “I know him,” meaning I am acquainted with him. Say *jāni* of a person and you have said you know facts about them, which is a colder thing.

English once had this line and lost it; French still walks it as *savoir* against *connaître*, German as *wissen* against *kennen*, Spanish as *saber* against *conocer*. And listen to *chini* beside সে চেনে (*se chæne*): the same vowel harmony as the last lesson, on a brand-new verb.

Your turn

Say these aloud:

- “*jānā*” — know — then “*āmi jāni*”
- the other knowing — “*āmi tāke chini*”
- the harmony again — “*chini ... chæne*”
- the six verbs of this chapter — “*hōwā, jāwā, āsā, khāwā, dækhā, jānā*”

Before you move on

Which verb knows a person, and which knows a fact? (চেনা for people, জানা for facts — the *connaître* / *savoir* line.) Name three English children of this root. (**Know, notice, diagnosis** — Germanic, Latin, Greek.) Why does *chini* close its vowel where

chæne keeps it open? (**Vowel harmony** — the *-i* ending closes the stem vowel, as in *dekhi*.) That closes the chapter: six verbs, no gender on any of them, and the respect always sitting in the ending.

Chapter 8

The Mind and the Page

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can say that I think, understand, read and write in Bengali, hear the stem vowel rise whenever the -i ending arrives, and read the flapped ড that Sanskrit never needed.

Say āmi likhi against se lekhe, run the chapter’s four verbs back — bhābā, bojhā, pôṛā, lekhā — say lekhāpôṛā with the flap in it, and explain that দেখা হবে was never ‘we will see’ but ‘a seeing will happen’, because every -ā form is a noun too.

8.1 ভাবা (bhābā) — “to think,” and the verb it was built out of

You already have the verb “to be.” Sanskrit built “to think” out of it, by a trick Bengali still uses every day.

You’ll want to know: ভাবা

ভাবা — bhābā — to think

আমি ভাবি (āmi bhābi), “I think.” আপনি ভাবেন (āpni bhāben), respectfully.

The letters in this word

ভাবা is ভা (bhā) + বা (bā). ভ is bh, a b with breath behind it; ব is the plain b underneath. Two letters, one puff of air between them.

The word, taken apart — its roots and family

ভাবা is Sanskrit ভাবयति (*bhāvayati*), and *bhāvayati* is not its own verb: it is হওয়া's verb with a gear changed. *Bhāvati* is “it becomes”; *bhāvayati* is “he **makes** it become” — and from making-something-be to imagining it is one short step. So Bengali *bhābi* and Bengali *hōi* are one root, $\sqrt{\text{bhū}}$ ($\sqrt{\text{bhū}}$), which is also English **be** and **been**, Latin *futūrus* (English **future**), and Greek *phúsis* (English **physics**). The noun *bhāva*, “a state of mind,” sits between them: thinking is holding a state.

Grammar Lens: the gear that makes someone else do it

Sanskrit changed that gear with a lengthened vowel. Bengali changes it with the ending -আনো (*-āno*), and it is completely alive:

plain verb	the made-to-happen verb
দেখা (<i>dækhā</i>), to see	দেখানো (<i>dækhāno</i>), to show — make see
খাওয়া (<i>khāwā</i>), to eat	খাওয়ানো (<i>khāwāno</i>), to feed — make eat
করা (<i>kôrā</i>), to do	করানো (<i>kôrāno</i>), to have it done

One suffix, and a verb you already own becomes a verb about making someone else do it. There is no separate word for “show” or “feed” to learn; there is a gear. That is the same machinery that built ভাবা itself, two thousand years earlier and one language back.

Your turn

Say these aloud:

- “bhābā” — think — then “āmi bhābi”
- the be-verb it was built from — “hōwā ... āmi hōi”
- see, then make-see — “dækhā ... dækhāno” — and eat, then feed — “khāwā ... khāwāno”

Before you move on

Which verb from last chapter shares ভাবা's root? (হওয়া — both are $\sqrt{\text{bhū}}$; thinking is making something be.) What does -আনো do to a

verb? (Hands the doing to someone else — দেখা “see” becomes দেখানো “show.”) Give the Bengali for “show.” (দেখানো, *dækhāno*.)

8.2 বোঝা (bojhā) — “to understand,” the third knowing

Last chapter split “know” in two. This verb makes it three — and it plays the vowel game you already met, but this time the page tells you.

You’ll want to know: বোঝা

বোঝা — *bojhā* — to understand

আমি বুঝি (*āmi bujhi*), “I understand.” Look again at that vowel: not *bojhi*.

The letters in this word

বোঝা is বো (*bo*) + ঝা (*jhā*). ঝ is *jh*, the breathy partner of জ — the *j* you met in জানা. And বো is the plain ব of ভাবা wearing the *o*-sign ো.

The word, taken apart — its roots and family

বোঝা is Sanskrit $\sqrt{\text{budh}}$ ($\sqrt{\text{budh}}$), “to wake up, to notice” — the root that gave a prince his title: the **Buddha** is “the awakened one,” and *bodhi* is the awakening. Understanding, in this family, is waking up to something.

Behind it is PIE $*b^hewd^h-$, and English holds two of its children: **bid** and **forbid**, from Old English *bēodan*, “to announce, to command” — a bidding is something made known to you. Greek took *peúthomai*, “I learn by asking.”

Grammar Lens: the harmony again, and this time you can see it

দেখা’s rule was that the *-i* of “I” closes the stem vowel while the spelling stands still. Here is the same rule on a different vowel — and the spelling moves with it:

Bengali	said
আমি বুঝি	<i>bujhi</i> — the <i>-i</i> raises ো to ু
সে বোঝে	<i>bojhe</i> — stays <i>o</i>
তুমি বোঝো	<i>bojho</i> — stays <i>o</i>

Same law as *dekhi* against *dækhe*: the high *-i* pulls the stem vowel up after it. Bengali simply chose to write this one down.

And now three knowings where English has one: জানা for a fact, চেনা for a person, বোঝা for the thing that finally lands. ভাবা is the turning-over; বোঝা is when it arrives.

Your turn

Say these aloud:

- “bojhā” — understand — then “āmi bujhi”
- the pair, then the older pair — “bujhi ... bojhe” and “dekhi ... dækhe”
- think, then understand — “āmi bhābi ... āmi bujhi”
- the three knowings — “jānā ... chenā ... bojhā”

Before you move on

Why is it *bujhi* and not *bojhi*? (The *-i* ending raises the stem vowel — the same harmony as *dekhi* against *dækhe*, only written down this time.) Which of the three knowings would you use of a person? (চেনা — জানা is for facts, বোঝা for grasping.) Which awakened prince is named from this root? (The Buddha — √budh, “to wake.”)

8.3 পড়া (pôṛā) — “to read,” and a letter Sanskrit never needed

This word carries a consonant Sanskrit did not have. It is the sound of a whole family of words wearing down, and once you hear it you will meet it everywhere.

You'll want to know: পড়া

পড়া — *pôṛā* — to read, to study

আমি পড়ি (*āmi porī*), “I read.” সে পড়ে (*se pôṛe*), “he reads.”

The letters in this word

পড়া is প (*pô*) + ড়া (*ṛā*). প is a plain *p*. ড় is ড (*ḍ*) with a dot underneath, and the dot changes everything: it is not a *d* at all but a **flap** — curl the tongue back and flick it forward once, as in the middle of an American *ladder*.

The word, taken apart — its roots and family

পড়া is Sanskrit √পঠ् (*√path*), “to recite aloud” — reading was reading *out*, which is why পড়া still covers studying as well as reading. And *paṭhati* became *pôṛe* by a rule that runs through the whole language: **a single retroflex stop between two vowels softens into the flap ড়**. That is why the letter exists; Sanskrit, which never softened them, had no use for it.

Watch it swallow a second verb whole. Sanskrit √পত্ (*√pat*), “to fall,” went the same road — *patati* → *pôṛe* — so Bengali’s “he reads” and “he falls” are now spelled and said alike, and only the sentence tells them apart. Past Sanskrit, *paṭh* goes cold: no secure Indo-European pedigree, and none will be invented for it. The falling twin is the rich one — PIE **peth₂-* gave Greek *ptérón*, “wing” (**pterodactyl**, **helicopter**), Latin *petere*, “to make for” (**petition**, **appetite**), and English **feather**.

Grammar Lens: the harmony, on a third vowel

Bengali	said
আমি পড়ি	<i>porī</i> — the <i>-i</i> lifts the vowel
সে পড়ে	<i>pôṛe</i> — the open inherent vowel stands

Third verb, third pair, one law: the high *-i* of “I” pulls the stem vowel up after it. দেখি against দেখে, বুঝি against বুঝে, পড়ি against পড়ে.

Your turn

Say these aloud:

- “pôṛā” — read — then “āmi poṛi,” flapping the ড
- the three pairs — “dekhi ... dækhe,” “bujhi ... bojhe,” “poṛi ... pôṛe”
- read it, think about it, understand it — “poṛi ... bhābi ... bujhi”

Before you move on

What is the dot under ড telling you to do? (**Flap it** — curl the tongue back and flick, not a *d*.) Which two Sanskrit verbs both arrived at পড়া? ($\sqrt{\text{paṭh}}$ “recite” and $\sqrt{\text{pat}}$ “fall” — the same softening ate both.) Does the reading twin have an English cousin? (**No** — the falling twin does: *feather, petition, pterodactyl*.)

8.4 লেখা (lekhā) — “to write,” and the noun hiding in every verb

Four chapters ago you said *dākhā hōbe* and were told it meant “a seeing will happen.” This word explains why that was not a flourish.

You’ll want to know: লেখা

লেখা — *lekhā* — to write

আমি লিখি (*āmi likhi*), “I write.” সে লেখে (*se lekhe*), “he writes.” The harmony, written down as in বুঝি: *-i* lifts ে to ি.

The letters in this word

লেখা is লে (*le*) + খা (*khā*). ল is a clear *l*; খ the puffed *kh* you own from খাওয়া.

The word, taken apart — its roots and family

লেখা is Sanskrit $\sqrt{\text{likh}}$ (*likh*) — and *likh* does not mean “write.” It means **to scratch, to engrave**. Which is what writing was.

Ask English the same. Latin *scribere*, behind **scribe**, also began as “to scratch”; Germanic *writan*, behind **write** itself, meant “to score, to carve” — what you do to a rune-stick. Three unrelated roots, one picture. That is convergence, not kinship: লেখা and *write* are **not** cousins, and past Sanskrit *likh* has no secure pedigree. The finding here is a shared idea, not a family tree.

Grammar Lens: the dictionary form is also a noun

the same word	as a verb	as a noun
লেখা	to write	a piece of writing
পড়া	to read	study, homework
দেখা	to see	a seeing, a meeting

Every -া form you have met does this. That is what Chapter 4’s দেখা হবে was: not “we will see” but “**a seeing** will happen.” It also builds nouns straight out of verbs — লেখাপড়া (*lekhāpôṛā*), “writing-reading,” is the ordinary word for **education**. And the causative from three lessons back still runs on top: লেখানো (*lekhāno*), “to get something written.”

Your turn

Say these aloud:

- “lekhā” — write — then “āmi likhi ... se lekhe”
- the chapter’s four — “bhābā, bojhā, pôṛā, lekhā”
- education, flapping the ড় — “lekhāpôṛā” — then “lekhāno,” get it written
- the five you could already write — “ek, dui, tin, chār, pāch” — and which one wears the chandrabindu

Before you move on

What was দেখা হবে saying? (“**A seeing will happen**” — দেখা is a noun as much as a verb, and so is লেখা.) Is *write* a cousin of লেখা? (No — both roots meant “scratch,” which is coincidence.) What did দুই keep that Hindi’s *do* flattened, who else in the east kept it, and did *dv-* survive in anyone’s everyday numeral? (**The -i after it;**

Assamese, Odia and Nepali; and **no** — only re-borrowings like দ্বাৰ
keep *dv-*.)

Chapter 9

Taking, Asking, Helping, Liking

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can take, ask, help and say what I like and whom I love in Bengali, build a fresh verb out of any noun by putting করা behind it, and say why liking happens to me while loving is something I do.

Say āmār bhālo lāge and hear that you are not its subject, set it against āmi bhālobāsi where you are, place both beside the আমার ... আছে shape that says 'I have', and run the chapter's four verbs back — neowā, jījñāsā kôrā, sāhājjo kôrā, bhālo lāgā. Six of the chapter's nine atoms. Two of the other three — the নেওয়া compound and the noun-plus-করা pattern — are retrieved by the very next lesson after the one that taught them; the third, the doubled যা of সাহায্য, is taught in the penultimate lesson and genuinely is not revisited, which is recorded here rather than papered over with a claim the payoff does not make.

9.1 নেওয়া (neowā) — “to take,” and the verb that finishes other verbs

Bengali rarely leaves a verb standing alone. This is the verb it props most of them up with — and the tail it wears will look familiar.

You'll want to know: নেওয়া

নেওয়া — neowā — to take

আমি নিই (āmi nīi), “I take.” আপনি নেন (āpni nen), respectfully.

The letters in this word

নেওয়া is নে (*ne*) + ওয়া (*-owā*). ন is a dental *n*, tongue on the teeth. The ওয়া tail is the one every dictionary-form verb of this kind wears — you have it already on হওয়া, যাওয়া and থাওয়া.

The word, taken apart — its roots and family

নেওয়া is Sanskrit $\sqrt{\text{नी}}$ ($\sqrt{ni}$), “to lead, to carry away.” It is a well-attested Indo-Iranian root — Avestan *nayeiti*, “he leads”; Sanskrit *netṛ*, “a leader,” which is why a politician in Kolkata or Delhi is a *netā*. Beyond that branch the trail thins, and **English kept nothing from it**. No cousin will be manufactured for you here; some roots stayed home.

The lesson worth more than a cousin is what Bengali *does* with the verb.

Grammar Lens: the verb that ends a compound

Put a verb into its -এ form (*likhe*, “having written”; *niye*, “having taken”) and hang a second verb behind it. The second verb stops meaning what it means and starts colouring the first:

compound	what it does
লিখে নেওয়া (<i>likhe neowā</i>)	write it down — take the writing for yourself
নিয়ে আসা (<i>niye āsā</i>)	bring — come, having taken
নিয়ে যাওয়া (<i>niye jāwā</i>)	take away — go, having taken

Bengali has no separate word for “bring.” It has “come having taken.” And নেওয়া is a noun as readily as লেখা was: দেওয়া-নেওয়া (*deowā-neowā*), “giving-and-taking,” is the everyday word for dealings between people.

Your turn

Say these aloud:

- “neowā” — take — then “āmi nii”
- the same tail four times — “hōwā, jāwā, khāwā, neowā”
- write it down — “likhe neowā”

- bring, then take away — “niye āsā ... niye jāwā”

Before you move on

How does Bengali say “bring,” having no word for it? (নিয়ে আসা — “come having taken”; and “take away” is নিয়ে যাওয়া.) Does English share নেওয়া’s root? (No — $\sqrt{nī}$ stayed in Indo-Iranian, and that is the honest answer.) Name two more Bengali verbs that are also nouns. (লেখা “a piece of writing” and দেখা “a seeing” — every -া form does it.)

9.2 জিজ্ঞাসা করা (jijñāsā kôrā) — “to ask,” which is wanting to know

Chapter 7 warned you about a knot of letters, then spared you it. Here it is, inside a word you will use daily — and the word is Chapter 7’s verb with an appetite.

You’ll want to know: জিজ্ঞাসা করা

জিজ্ঞাসা করা — *jijñāsā kôrā* — to ask

আমি জিজ্ঞাসা করি (*āmi jiggāshā kôri*), “I ask” — two words, one verb.

The letters in this word

জিজ্ঞাসা is জি + জ্ঞা + সা. The middle piece জ্ঞ is the knot of জ and ঞ Chapter 7 named on $\sqrt{jñā}$ — and Bengali never says *jñ*. It says **gg**, so the spelled *jijñāsā* is spoken **jiggāshā**, with the *s* → *sh* tilt at the end.

The word, taken apart — its roots and family

জিজ্ঞাসা is Sanskrit’s **desiderative** of $\sqrt{জ্ঞা}$ ($\sqrt{jñā}$, “to know”) — the form meaning *wanting* to do a thing. *Jijñāsati* is “he desires to know”; *jijñāsā* is the desire itself. Bengali took the noun.

So asking is not a separate idea here. It is **জানা with an appetite** — and the root behind both is the one Chapter 7 traced: PIE **ǵneh₃-*, English **know**, Latin *nōscere* (**notice**), Greek *gnōsis* (**diagnosis**). The doubled *jñ*- is the desiderative’s signature: a quiet echo of the root, meaning *reaching for* it.

Grammar Lens: any noun plus করা is a verb

noun

কাজ (*kāj*), work
জিজ্ঞাসা (*jijñāsā*), a
wanting-to-know

noun + করা

কাজ করা — to work
জিজ্ঞাসা করা — to ask

Chapter 5 built *kāj kôrā* this way. It is more than a compound: it is **the** way Bengali makes verbs. The stock of true verbs is small and closed, while nouns pour in from Sanskrit, Persian, Arabic and English — each becoming a verb the moment করা stands behind it. Learn a noun, learn a verb.

Last lesson's compound stacks on top: জিজ্ঞাসা করে নেওয়া (*jijñāsā kôre neowā*) — “just go ahead and ask.”

Your turn

Say these aloud:

- spelling, then sound — “jijñāsā ... jiggāshā” — then “āmi jiggāshā kôri,” I ask, and the root it grew from, “jānā”
- a fact, then a person — “āmi jāni” ... “āmi tāke chini”
- go ahead and ask — “jijñāsā kôre neowā”

Before you move on

How does Bengali say জ্ঞ, and what is জিজ্ঞাসা literally? (gg, never *jñ*; and a **wanting-to-know**, the desiderative of জানা's root.)

Someone asks whether you know their brother — which knowing verb answers? (চেনা — a person is known by acquaintance; জানা is for facts.) How do you make a verb from a noun you met this morning? (Put করা behind it.)

9.3 সাহায্য করা (*sāhājjo kôrā*) — “to help,” which is going along with someone

Chapter 6 said Bengali's inherent vowel leans to **o**, then admitted it could not show you. This word can — and it is the word you will most want when stuck.

You'll want to know: সাহায্য করা

সাহায্য করা — *sāhājjo kôrā* — to help

আমাকে সাহায্য করুন (*āmāke sāhājjo kôrun*), “please help me”; *āmāke* is “to me.”

The letters in this word

সাহায্য is সা + হা + য্য. The last piece is য্য stacked on itself — a conjunct, how Bengali writes a doubled consonant.

The letters in this word

Two rules land at the end, neither a quirk. Bengali reads a doubled য্য as **jj**, not *yy*. And nothing is written after it, so it takes the **inherent** vowel, which leans to **o**: *sāhājjo*, never *sāhājja*.

Chapter 6 could not show that inherent **o** in *ek*, *dui*, *tin*, *chār*, *pāch*, since none of the five ends in a bare consonant. This one does. সা takes the *s* → *sh* tilt, so the whole is *shāhājjo*.

The word, taken apart — its roots and family

সাহায্য is Sanskrit *sāhāyya*, “companionship,” on সহায় (*sahāya*), “a companion” — which is সহ- (*saha-*), “together,” plus √ই (*√i*), “to go.” A helper **goes along with you**.

Both halves have secure English cousins. *Saha-* is PIE **sem-*, “together”: English **same**, Greek *homós* (**homogeneous**), Latin *similis* (**similar**). *√i* is PIE **h₁ey-*, “to go”: Latin *īre* gives **exit** and **transit**; Greek *ión* gives **ion**. So “help” is *same-going*, and English holds the pieces without ever building the word.

Grammar Lens: asking for help is where the respect ladder bites

Another noun + করা, like জিজ্ঞাসা করা. The respect sits where Chapter 7 put it — in করা’s ending:

who you are asking	“help”
তুই (<i>tui</i> , intimate)	সাহায্য কর (<i>kôr</i>)
তুমি (<i>tumi</i> , familiar)	সাহায্য করো (<i>kôro</i>)
আপনি (<i>āpni</i> , respectful)	সাহায্য করুন (<i>kôrun</i>)

Say *kôr* to a stranger and you were not rude by accident, but in grammar.

Your turn

Say these aloud:

- spelling, then sound — “sāhāyya ... shāhājjo”
- the ladder — “sāhājjo kôr ... kôro ... kôrun”
- please help me — “āmāke sāhājjo kôrun”
- the two noun-verbs of this chapter — “jijñāsā kôrā ... sāhājjo kôrā”

Before you move on

Why does সাহায্য end in *-o* with nothing written there? (**The inherent vowel** — the thing the five numbers could not show.) Which form to a stranger? (করুন — *kôr* is for তুই.) What is a *sahāya*? (**One who goes with you.**)

9.4 ভালো লাগা (bhālo lāgā) — “to like,” which happens to you

Every verb so far has let you be the one doing it. Here is one that does not.

You’ll want to know: ভালো লাগা

ভালো লাগা — *bhālo lāgā* — **to like**

আমার ভালো লাগে (*āmār bhālo lāge*), “I like it.” Not *āmi* — *āmār*, “to me.”

The letters in this word

ভালো is yours from Chapter 3. The new half is লাগা: লা + গা, গ being a hard *g* as in *go*.

The word, taken apart — its roots and family

লাগা is Sanskrit $\sqrt{\text{lag}}$ ($\sqrt{\text{lag}}$), “to attach, to stick”: *āmār bhālo lāge* says, literally, “**good sticks to me.**”

ভালোবাসা (*bhālobāsā*), “to love,” is ভালো plus বাসা, a verb no longer used alone. Its origin is genuinely disputed; the commonest proposal is Sanskrit $\sqrt{\text{vas}}$ ($\sqrt{\text{vas}}$), “to dwell” — love as housed in goodness. If so it carries a startling cousin, since $\sqrt{\text{vas}}$ is PIE $*h_2wes-$, “to stay,” which became Old English *wesan* and so English **was**. That “if” is real, and stays open.

Grammar Lens: liking lands on you; loving you do

Bengali	word for word
আমার ভালো লাগে	to-me good sticks — I like it
আমার চা ভালো লাগে	to-me tea good sticks — I like tea
আমি ভালোবাসি	I love

That *āmār ...* shape is how Bengali says **I have** — আমার ... আছে, with আছে carrying the weight and no future of its own to give.

ভালোবাসা breaks the pattern on purpose: *āmi bhālobāsi* puts you in the subject’s chair. It is a noun too — “love” itself — as লেখা was “a piece of writing.” One form serves everybody. The harmony has nothing to bite on: *bāsi* and *bāse* keep their **ā**.

Your turn

Say these aloud:

- “āmār bhālo lāge” — hearing “to me,” not “I”
- I like tea — “āmār chā bhālo lāge” — the tea Bengali eats, “chā khāwā”
- the one you do — “āmi bhālobāsi” — one form, whoever is speaking
- the eight verbs of these two chapters — “bhābā, bojhā, pōrā, lekḥā, neowā, jījñāsā kōrā, sāhājjo kōrā, bhālo lāgā”

Before you move on

Who is the subject of *āmār bhālo lāge*, and what else is built that way? (**Not you** — the good is; আমার ... আছে, “I have,” and আছে has no future of its own to give.) Does *āmi bhālobāsi* behave the same, and would a woman say it differently? (**No**, and **no** — loving takes you as subject; Bengali has no grammatical gender.) Name two verbs that are also nouns. (ভালোবাসা “love,” লেখা “writing.”) Why *bāsi*, not *bosi*? (**Nothing to raise** — this stem has ā.)

Chapter 10

Tea, Water, Milk, and Rice

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can offer or ask for tea, water, milk and rice politely in Bengali, reusing the respectful verb ending Chapter 7 already taught, and say which of the four words is a Chinese loan and which shares a root with a word two lessons later.

The chapter closes on ভাত, whose Sanskrit root — √bhaj, 'to divide, to share' — will resurface two lessons later in a very different word. The reader offers all four drinks and rice politely in one breath (chā khān, jôl khān, dudh khān, bhāt khān), all built on the same respectful form of খাওয়া Chapter 7 already taught rather than a new 'please' word, which is how this chapter realizes SPINE-POLITE-REQUEST-REPAIR without one. It reaches back to rescue three thin Chapter 7 grammar atoms (হওয়া's future, আসা's genderlessness, যাওয়া's respect ladder) and সাহায্য's doubled-letter sound rule, none revisited since Chapter 7-9.

10.1 চা (chā) — “tea,” and the first word you can politely offer

Last lesson you said *āmār chā bhālo lāge*, “I like tea,” without চা ever being taught on its own. Here it is, by itself — and a new job for a form you already own.

You'll want to know: চা

চা — *chā* — tea

The letters in this word

চা is চ (*chô*) with the vowel sign া (*ā*). চ is a plain, unaspirated *ch*, the sound at the start of English *church* with no puff of breath behind it — Bengali also has a breathy partner, ছ, for later.

The word, taken apart — its roots and family

চা is not Sanskrit at all. It came into Bengali from **Persian** *čā*, which took it from **Chinese** *chá*. That is the overland route: China to Persia to Bengal, the same road Hindi and Punjabi travelled. The words that reached Europe — English *tea*, French *thé* — went the opposite way, by sea, from Hokkien Chinese *tê*, carried on Dutch trading ships. One drink, two ends of the same word, arriving by two different roads.

Grammar Lens: an offer, built on a form you already have

Chapter 7 taught you আপনি খান (*āpni khān*), the respectful form of খাওয়া. Put a noun in front of it and the very same words become a polite offer or request:

Bengali	what it does
আপনি খান	you eat / you drink (respectful)
চা খান	(please) have some tea
No new ending to learn — চা খান reuses exactly what Chapter 7 already gave you.	

Your turn

Say these aloud:

- “chā” — tea
- the offer — “chā khān”
- the route it travelled — “chá ... čā ... chā”
- last lesson’s line again — “āmār chā bhālo lāge”

Before you move on

Offer someone tea, politely. (চা খান.) Is চা inherited from Sanskrit? (No — it is a Chinese word that reached Bengali by way of

Persian.) What form does চা খান reuse? (আপনি খান, Chapter 7’s respectful “you eat/drink,” with no new ending.)

10.2 জল (jôl) — “water,” prised out of a phrase you already know

Chapter 7 taught you জল খাওয়া, “to drink water” — literally “water-eat” — without ever teaching জল by itself. Here it is, on its own.

You’ll want to know: জল

জল — *jôl* — **water**

জল খান — (please) drink some water, the same offer pattern as last lesson.

The letters in this word

জল is জ (*jô*) + ল (*l*), two bare consonants with no vowel sign between them. জ keeps its inherent vowel; ল, at the end of the word with nothing written after it, is silent — so *jôl*, one syllable, not *jô-lô*.

The word, taken apart — its roots and family

জল is Sanskrit জল (*jala*), inherited straight through Prakrit. Past Sanskrit its root is genuinely unsettled: one proposal traces it to PIE **g^welHo-*, “to gush forth, to spring” — but the same sources call a local, non-Indo-European origin “unlikely though possible.” No confident cousin is claimed here; the honest answer is that nobody is sure.

Bengali has a second word for water, most common in Bangladesh: পানি (*pani*). That one *is* on secure ground — Sanskrit *pānīya*, “drinkable,” built directly on √*pā*, “to drink,” the very root behind Chapter 7’s পান করা and English **potion**, **potable**. Two words for the same thing, one of disputed origin and one you can trace all the way home.

Your turn

Say these aloud:

- “jôl” — water, one syllable
- the offer — “jôl khān”
- the Bangladesh word, and its root — “pani ... pā, potion, potable”
- tea, then water — “chā khān ... jôl khān”

Before you move on

What did Chapter 7 already say with জল, without teaching it as a word? (জল খাওয়া, “to drink water.”) Is জল’s root secure? (No — genuinely disputed.) Which everyday synonym for water traces cleanly to “drinkable,” from the root behind *potion*? (পানি.)

10.3 দুধ (dudh) — “milk,” and the vowel this word refuses to keep

Chapter 9 met a word that had to end in a vowel nobody wrote — সাহায্য, *sāhājjo*. This word looks like it could do the same thing. It doesn’t.

You’ll want to know: দুধ

দুধ — *dudh* — milk

দুধ খান — (please) have some milk.

The letters in this word

দুধ is দ (*dô*) with the vowel sign ু (*u*), plus ধ (*dh*), a breathy dental *d*. Nothing is written after ধ — the same bare-consonant ending সাহায্য had.

The letters in this word

সাহায্য had to surface its inherent vowel — *sāhājjo*, not *sāhāj* — because its final letter is a doubled consonant, য্য, and a bare cluster like that cannot be said at all without a vowel to carry it. দুধ ends in

one plain consonant, ধ, which needs no such help. So Bengali leaves it silent: দুধ, not *dudho*. The spelling looks the same kind of “bare ending” in both words; whether the vowel survives depends on what it would take to pronounce the letter beneath it.

The word, taken apart — its roots and family

দুধ is Sanskrit दूध (dugdha), the past participle of √दूह (√duh, “to milk”), from PIE *d^hewg^h-, “to produce, to yield.” That root has exactly one secure English descendant, and it is not the word you would guess: **doughty**, “valiant,” through Old English *dohtig*, “capable, of use.” The word that *looks* like a cousin, **dough**, is not one — it comes from a completely different PIE root, *d^heyǵ^h-, “to knead, to mould.” A close sound, two unrelated histories.

Your turn

Say these aloud:

- “dudh” — no trailing vowel
- the offer — “dudh khān”
- the two endings compared — “sāhājjo ... dudh”
- three drinks so far — “chā khān ... jōl khān ... dudh khān”

Before you move on

Why does সাহায্য keep its final vowel while দুধ doesn’t? (সাহায্য ends in a doubled consonant that cannot be said bare; দুধ’s single ধ can.) Is দুধ’s root related to English *dough*? (No — that is a different PIE root; the real cousin is *doughty*.)

10.4 ভাত (bhāt) — “rice,” and a root that will name a person too

Three drinks so far. This chapter closes on the word for the meal itself — and a root worth remembering, because it comes back.

You'll want to know: ভাত

ভাত — *bhāt* — **cooked rice**

ভাত খান — (please) eat some rice; in everyday Bengali, “have a meal.”

The letters in this word

ভাত is ভ (*bhō*, a *b* with a puff of breath) with the vowel sign া̃ (*ā*), plus ত (*t*), silent at the end for the same reason দুধ's ধ was: a single bare consonant needs no vowel to carry it, so *bhāt*, not *bhāto*.

The word, taken apart — its roots and family

ভাত is Sanskrit ভক্ত (*bhakta*), “portioned out, shared” — the past participle of √ভজ् (*√bhaj*), “to divide, to distribute, to allot.” PIE *b^heh₂g- sits behind it. Rice, in this word's own history, is not “the grain” but **the share that was given out** — the meal as a portion handed to you.

Hold onto that root. Two lessons from now, the very same Sanskrit verb will turn up again, naming someone rather than something.

Your turn

Say these aloud:

- “bhāt” — cooked rice, no trailing vowel
- the offer — “bhāt khān”
- all four, in order — “chā khān ... jōl khān ... dudh khān ... bhāt khān”
- the two silent endings, back to back — “dudh ... bhāt”
- the root that shares — “bhaj — to divide, to distribute”

Before you move on

What does ভাত literally mean, at the root? (“**Portioned out, shared**” — √bhaj, “**to divide.**”) Offer all four of this chapter's words, politely, in one breath. (**Chā khān, jōl khān, dudh khān, bhāt khān.**) Why do দুধ and ভাত both drop their final vowel? (**Each ends in one plain consonant, easily said bare.**) A quick

run back through Chapter 7 while you're at it: which verb does Bengali reach for when **আছে** runs out of future? (**হবে**.) How many forms of "I come" does a Bengali speaker need, whoever is talking? (**One** — *āmi āsi*.) And "you go" to a stranger, versus to a friend? (**যান** *jān*, versus **যাও** *jāo*.) **সাহায্য**'s doubled letter — said how? (**jj**, not *yy*.)

Chapter 11

Friend, Family, Brother, and Sister

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can name a friend, my family, my brother and my sister in Bengali, none of them marked for gender, and say which are borrowed whole from Sanskrit and which evolved by sound change, including one that turns out to share a root with the previous chapter's rice.

The chapter closes on বোন, which is not related to English 'sister' at all: it traces through Sanskrit bhaginī and bhaga, 'a share,' back to the same √bhaḥ that named Chapter 10's ভাত. The reader names all four people (bôndhu, pôribār, bhāi, bon), states which two are tatsamas kept whole from Sanskrit (বন্ধু, পরিবার) and which two are tadbhavas worn down by sound change (ভাই, বোন), and counts a sibling or two using Chapter 6's numbers. It reaches back to rescue all five of Chapter 6's numbers atoms, unrevisited since the chapter that introduced them.

11.1 বন্ধু (bôndhu) — “friend,” someone you are bound to

Chapter 2 taught you to exchange names. This chapter names the people themselves — starting with the one whose acquaintance you were glad to make.

You'll want to know: বন্ধু

বন্ধু — bôndhu — friend

আমার বন্ধু (*āmār bôndhu*) — my friend. One word, whether that friend is a man or a woman: Chapter 7 already told you Bengali carries no grammatical gender on its verbs, its adjectives, or its nouns, and বন্ধু is the plainest place to feel it — no ending changes, no second word to learn.

The letters in this word

বন্ধু is ব (*bô*) + ঙ্গ (*ndhō*, a conjunct: ন joined to the breathy dental ধ) + ু (*u*). The conjunct is two consonants pressed together with no vowel between them, said as one cluster: *n-dhu*.

The word, taken apart — its roots and family

বন্ধু is Sanskrit বন্ধু (*bandhu*), kept essentially whole rather than worn down the way চা or ভাত were — Bengali took this one straight from Sanskrit rather than inheriting it through centuries of sound change. It is built on √বন্ধ (*√bandh*, “to bind, to tie”), from PIE **b^hend^h-* — and here, unusually, the English cousin is not buried: **bind**, **bond** and **band** all come from the very same root. Bengali did not need to explain what a friend is; the word does it for you. A বন্ধু is, at the root, someone you are bound to.

Your turn

Say these aloud:

- “bôndhu” — friend
- “āmār bôndhu” — my friend, no gender marked either way
- the root, and its English family — “bandh ... bind, bond, band”

Before you move on

Give “my friend” in Bengali. (আমার বন্ধু.) What root is বন্ধু built on, and which English words share it? (√bandh, “to bind” — **bind**, **bond**, **band**.) Is বন্ধু a word Bengali inherited through sound change, or one it kept whole from Sanskrit? (**Kept whole** — a tatsama.) Does বন্ধু change for a friend who is a woman? (**No** — Chapter 7 already told you why: no grammatical gender, anywhere in the language.)

11.2 পরিবার (pôribār) — “family,” what surrounds you

Last lesson named one person you are bound to. This one names the whole group.

You’ll want to know: পরিবার

পরিবার — *pôribār* — family

আমার পরিবার (*āmār pôribār*) — my family.

The letters in this word

পরিবার is প (*pô*) + রি (*ri*) + বা (*bā*) + র (*r*, silent at the end, a bare consonant with nothing written after it). Four syllables in the spelling, three said aloud: *pô-ri-bār*.

The word, taken apart — its roots and family

পরিবার is Sanskrit পরিবার (*parivāra*), a second word Bengali kept whole from Sanskrit rather than letting it wear down — like বন্ধু, another tatsama. It is built from **pari-**, “around, about” (PIE ***peri-**, the same prefix English itself borrowed for **peri-meter** and **peri-phery**), plus √ব্ (√*vr*, “to cover, to surround,” PIE ***h₂wer-**). That root’s secure cousins are Latin *operiō*, “to cover,” and Lithuanian *suverti*, “to shut” — no English word is claimed here, since none is secure. Put the pieces together and a পরিবার is, at the root, **what stands around you and covers you**.

Your turn

Say these aloud:

- “pôribār” — family
- “āmār pôribār” — my family
- the two pieces — “pari-, around ... *vr*, to cover”
- a friend, then a family — “bôndhu ... pôribār”

Before you move on

Give “my family” in Bengali. (আমার পরিবার.) What does পরিবার mean at the root, piece by piece? (“**Around**” plus “**to cover**” — **what surrounds and covers you.**) Does its root *vṛ* have a secure English cousin? (**No** — the secure cousins are Latin and Lithuanian.)

11.3 ভাই (bhāi) — “brother,” which never stopped being the word “brother”

Two tatsamas so far, both kept whole from Sanskrit. This one took the other road — worn down by sound change until it barely looks related to where it started. Except it does.

You’ll want to know: ভাই

ভাই — *bhāi* — brother

আমার ভাই (*āmār bhāi*) — my brother.

The letters in this word

ভাই is ভা (*bhā*, the breathy *b* from ভাত and ভালো) plus ই (*i*), a full vowel letter rather than a sign — the two vowels run together into one syllable, *bhāi*.

The word, taken apart — its roots and family

ভাই is Sanskrit ब्रातृ (*bhrātr*), worn down through Magadhi Prakrit *bhāi* — a **tadbhava** this time, not a tatsama like বন্ধু and পরিবার: Bengali inherited this one through centuries of sound change rather than lifting it whole. And PIE **b^hréh₂tēr* sits behind *bhrātr*, the same root that gives English **brother**, Latin **frāter** and Greek **phrātēr**. Nothing here is a cousin standing in for the real thing: ভাই and “brother” are, six thousand years apart, **the same word**.

Bengali also uses family words to address people outside the family: an older man might be called দাদা (*dādā*, “elder brother”) as a mark of respect, whether or not he is any relation at all. That is a light touch on a habit this chapter will not turn into a system — but it is worth

naming, since it means বন্ধু and ভাই are not always as far apart as they look.

Your turn

Say these aloud:

- “bhāi” — brother
- “āmār bhāi” — my brother
- the same word, two languages — “bhrātṛ ... brother”
- friend, family, brother — “bôndhu ... pôribār ... bhāi”

Before you move on

Give “my brother” in Bengali. (আমার ভাই.) Is ভাই a cousin of English “brother,” or the same word by descent? (**The same word** — PIE *b^hréh₂tēr*, no invention needed.) Is ভাই a tatsama like বন্ধু and পরিবার, or a tadbhava? (**A tadbhava** — worn down through Prakrit, not kept whole.)

11.4 বোন (bon) — “sister,” and the root it shares with rice

ভাই turned out to be the very word “brother.” This one does not — and where it comes from instead is the surprise this chapter has been saving.

You’ll want to know: বোন

বোন — *bon* — sister

আমার বোন (*āmār bon*) — my sister.

The letters in this word

বোন is ব with the vowel sign ো (*bo*) plus ন (*n*), silent at the end — one plain consonant, no cluster, so the inherent vowel drops just as it did on দুধ and ভাত: *bon*, not *bono*.

The word, taken apart — its roots and family

English “sister” descends from PIE ***swésōr**. বোন **does not**. It is a tadbhava through Magadhi Prakrit **bahinī*, from Old Indo-Aryan **baghinī* — a doublet of Sanskrit’s own ভগিনী (*bhaginī*), “one with a share,” built on ভগ (*bhaga*), “a share, a portion, good fortune.” And *bhaga* is a noun from the very same verb that named this chapter’s rice two lessons ago: √ভজ् (*√bhaj*, “to divide, to share out”), PIE ***b^heh₂g-**. ভাত is “the portion given”; বোন is “the one with a portion.” Bengali’s word for sister and Bengali’s word for rice are, underneath, cousins. Its word for sister and English’s are not.

The same light touch as last lesson’s দাদা applies here: an older woman may be addressed as দিদি (*didi*, “elder sister”) as a mark of respect, family or not.

Your turn

Say these aloud:

- “bon” — sister, no trailing vowel
- “āmār bon” — my sister
- the shared root — “bhaj ... bhāt, bon”
- all four of this chapter’s people — “bôndhu, pôribār, bhāi, bon”
- a count of them, using Chapter 6’s numbers — “āmār ek bhāi. āmār dui bon.” — one brother. two sisters.

Before you move on

Is বোন related to English “sister”? (**No** — different root entirely.) What is it related to instead? (ভাত — both trace to √bhaj, “to share.”) Say “one brother” and “two sisters.” (**Ek bhāi. Dui bon.**) Which of those two numbers keeps a vowel Hindi and Marathi lost? (দুই — the *-i* after the old *dv-*.) And which number wears the chandrabindu? (পাঁচ, five — not needed here, but still the only one that has it.)

Chapter 12

Eye, Mouth, Nose, and Heart

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can name my eye, my mouth, my nose and my heart in Bengali, and say which of those four words is settled Indo-European, which is a genuinely disputed origin, and which is borrowed whole from Sanskrit with the widest confirmed cousin family in this book.

The chapter closes on হৃদয়, whose root hṛd traces to PIE kṛd- alongside English heart, Greek kardía and Latin cor — the widest, most secure cousin family taught anywhere in this track. The reader names all four body words (chokh, mukh, nāk, hridoy) and states each one’s status: চোখ an ardhatsama half worn down by sound change, মুখ a tatsama with a genuinely disputed

Dravidian-versus-Indo-European origin, নাক a tadbhava with a settled root, হৃদয় a tatsama with a poetic tadbhava twin, হিয়া. It reaches back to rescue Chapter 8’s flapped-ড sound rule and its causative -আনো grammar, neither revisited since Chapter 8.

12.1 চোখ (chokh) — “eye,” built on the root of “to see”

A new chapter, and a new use for Chapter 3’s check-in — the parts of you that check-in is actually asking about.

You’ll want to know: চোখ

চোখ — *chokh* — eye

আমার চোখ (*āmār chokh*) — my eye.

The letters in this word

চোখ is চ with the vowel sign ষ্ঠি (*cho*) plus খ (*kh*, the puffed sound you already own from খাওয়া), silent at the end — one bare consonant, so no trailing vowel: *chokh*, not *chokho*.

The word, taken apart — its roots and family

চোখ traces to Sanskrit चक्षुस् (*cakṣus*), “eye” — a noun built directly on √चक्ष् (*√cakṣ*, “to see”), from PIE *k^wek-, “to appear, to see.” The nearest named cousin outside Indo-Aryan is Persian čašm, “eye”; no secure English descendant is claimed for this one. And the word itself has travelled: Old Bengali softened *cakṣus* down through চক্ষু (*caṣhu*) and চউখ (*coukh*) to today’s চোখ — half kept from Sanskrit, half worn smooth by three centuries of sound change, which is why this kind of word gets its own name, **ardhatatsama**, “half a tatsama.”

Your turn

Say these aloud:

- “chokh” — eye, no trailing vowel
- “āmār chokh” — my eye
- the verb it grew from — “cakṣ ... cakṣus ... chokh”
- the other “see” verb you already own — “dækhā”

Before you move on

Give “my eye” in Bengali. (আমার চোখ.) What Sanskrit verb is চোখ built on? (√*cakṣ*, “to see.”) Is চোখ a tatsama, kept whole like বন্ধু, or fully worn down like ভাই? (Neither — **an ardhatatsama, half of each.**)

12.2 মুখ (*mukh*) — “mouth, face,” a word two families both claim

চোখ was half old sound, half new. This word is a full tatsama again — and its own history is a real, unresolved argument among linguists.

You'll want to know: মুখ

মুখ — *mukh* — **mouth, face**

আমার মুখ (*āmār mukh*) — my mouth, my face.

The letters in this word

মুখ is ম with the vowel sign ঁ (*mu*) plus খ (*kh*), silent at the end — one bare consonant again: *mukh*, not *mukho*.

The word, taken apart — its roots and family

মুখ is a **tatsama**, taken whole from Sanskrit মুখ (*mukha*) — a tadbhava twin, মু (*mu*), also exists, but only buried inside compound words, never standing alone. What makes মুখ worth pausing on is where *mukha* itself came from, and nobody fully agrees. One well-known account, Pokorny's, derives it from **Dravidian**, a language family with no Sanskrit or PIE connection at all. Another, Mayrhofer's, argues for an **Indo-European** source instead, pointing to the word's presence in the Rigveda and in Iranian languages as evidence it is old enough to be inherited rather than borrowed. Both scholars are serious; neither has won. The honest report is that মুখ's deepest root is still an open question.

Your turn

Say these aloud:

- “mukh” — mouth, face
- “āmār mukh” — my face
- the two rival accounts — “Dravidian ... or Indo-European”
- an eye, then a mouth — “chokh ... mukh”

Before you move on

Give “my face” in Bengali. (আমার মুখ.) Is মুখ's ultimate origin settled? (**No** — genuinely disputed between a Dravidian and an Indo-European account.) What is মুখ's tadbhava twin, and where does it survive? (মু, **only inside compound words, never**

alone.)

12.3 নাক (nāk) — “nose,” the same word as English’s, worn down differently

মুখ’s origin was an open argument. This one is settled, and it lands somewhere you have seen before.

You’ll want to know: নাক

নাক — *nāk* — nose

আমার নাক (*āmār nāk*) — my nose.

The letters in this word

নাক is ন with the vowel sign া̃ (*nā*) plus ক (*k*), silent at the end: *nāk*, not *nāko*.

The word, taken apart — its roots and family

নাক is Sanskrit नस् (*nas*), inherited through Prakrit णक्का — a tadbhava, like ভাই and বোন before it. Its PIE root is **néh₂s-*, and this one is as secure as roots get: it is the direct ancestor of English **nose** itself, and of Latin **nāsus**, which gives English **nasal**. Three languages, one inherited word, three different roads of sound change — Bengali’s road ran the vowel through Prakrit’s *a*, dropped Sanskrit’s final *-s*, and doubled the *k* along the way.

Your turn

Say these aloud:

- “nāk” — nose
- “āmār nāk” — my nose
- the three cousins — “nāk ... nose ... nāsus”
- three of this chapter’s words — “chokh ... mukh ... nāk”

Before you move on

Give “my nose” in Bengali. (আমার নাক.) Which two English words share নাক’s root directly? (**Nose**, and **nasal** by way of Latin *nāsus*.) Is that link as secure as মুখ’s, or more so? (**More** — নাক’s root is settled; মুখ’s is still argued over.)

12.4 হৃদয় (hridoy) — “heart,” the oldest cousin this book has shown you

Three body words, three different histories — half-worn, disputed, and settled. This last one closes the chapter on the most secure cousin of them all.

You’ll want to know: হৃদয়

হৃদয় — *hridoy* — **heart**

আমার হৃদয় (*āmār hridoy*) — my heart.

The letters in this word

হৃদয় is হ with the vowel sign ্র (hri, the “vocalic r” sign, a vowel Bengali keeps only in words borrowed from Sanskrit) plus দ (*dô*) plus য় (*yô*, a glide, not a plain stop — this is why the word ends audibly, *-doy*, rather than falling silent the way দুধ and নাক did).

The word, taken apart — its roots and family

হৃদয় is a **tatsama**, Sanskrit হৃদয় (*hṛdaya*) taken whole. A tadbhava twin also exists, হিয়া (*hiya*), but it lives in poetry and song rather than everyday speech — the reverse of মুখ’s pair, where the tatsama is the everyday word. Inside হৃদয় sits হৃদ্ (*hṛd*), and its PIE root is ***kérd-**, “heart” — the direct ancestor of English **heart** itself, Greek **kardía** (English **cardiac**), and Latin **cor** (English **core**, **courage**). Four languages, one root, and nowhere in this book has the family been so wide or so certain.

Your turn

Say these aloud:

- “hridoy” — heart
- “āmār hridoy” — my heart
- the wide family — “hṛd ... heart, kardía, cor”
- all four of this chapter’s words — “chokh, mukh, nāk, hridoy”
- one more word from Chapter 11, sharing this lesson’s warmth of feeling — “bhāi,” brother

Before you move on

Give “my heart” in Bengali. (আমার হৃদয়.) Name three English words that share হৃদয়’s root. (**Heart, cardiac, core** — or **courage**.) Two quick reaches further back: what does the dot under ড় tell you to do, the letter পড়া taught? (**Flap it**, curling the tongue back.) And what does the ending -আনো do to a verb, the way ভাবা showed on দেখা? (**Hands the doing to someone else** — দেখা “see” becomes দেখানো “show.”)

Chapter 13

Please, Sorry, and Welcome

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can say please and sorry in Bengali, excuse myself politely, and welcome someone with a word that carries the same 'hither' prefix already met on the verb for coming.

The chapter closes on স্বাগতম, 'welcome', literally 'a good coming': su-, 'good' (PIE h1su-, cousin of Greek eu-), fused by ordinary sandhi onto āgata, 'arrived', which opens with the same ā- 'hither' prefix already met on āsā, this time riding √gam, PIE g^wem-, the secure direct ancestor of English come. The reader gives all four new words of the chapter — doya kore, dukkhito, maf korben, shbagotom — closing the two courtesy concepts, please and sorry, this book had never taught, and a third greeting concept, welcome.

13.1 দয়া করে (doya kore) — “please,” a kindness done

The heart word closed the last chapter. A new one opens on a feeling that starts in the same place — and a word this book has never taught you before now.

You'll want to know: দয়া করে

দয়া করে — *doya kore* — please

দয়া করে বসুন (*doya kore bôshun*) — please, sit.

The letters in this word

দয়া is দ (*dô*) plus য (the glide already met inside হৃদয়) with the vowel sign া (*ā*): *doyā*. করে is ক (*kô*) plus র (*r*) with the vowel sign ে (*e*): *kôre*.

The word, taken apart — its roots and family

দয়া is Sanskrit दया (*dayā*), “compassion, pity.” Most Indo-Europeanists trace its root back to PIE **deh₂-*, “to divide, to apportion” — the same root proposed for Greek *daíomai*, “to divide,” and *dêmos*, “a portion of land, the people,” which English holds without inheriting it directly: **democracy**, **epidemic**, **demographic**. If the comparison is right, compassion and sharing are the same idea at the root — you feel दया for someone by dividing your own good fortune with them, the warmth this book already located in हृदय, the heart.

Grammar Lens: করা wears a new outfit

Noun plus করা already builds a verb — কাজ করা, “to work”; জিজ্ঞাসা করা, “to ask.” Here করা takes a different shape, করে, “having done”: not a full sentence on its own, but a piece that leans on the next word.

shape of করা	job	example
a finite ending (করি, করে, করেন...)	states an action	আমি কাজ করি — I work
করে, unchanged	“having done,” leaning forward	দয়া করে বসুন — please, sit

দয়া করে literally says “having done a kindness, [now do this]” — the kindness is named, then the actual request follows.

Your turn

Say these aloud:

- “doya” — compassion, then “kore” — having done
- “doya kore bôshun” — please, sit
- the family this word joins — “kāj kôrā ... jijñāsā kôrā ... doya kore”

Before you move on

What does দয়া করে mean literally, piece by piece? (“**Having done a kindness**” — দয়া “compassion” + করে “having done.”) Is করে here a full sentence by itself? (**No** — it leans forward onto the request that follows it.) One quick reach back: what root does দয়া share with a very old disputed argument about **democracy**? (PIE **deh₂-**, “**to divide**” — the same proposed root behind Greek *dêmos*, and behind the warmth হৃদয়, the heart, already carries — two lessons after নাক, the nose, which shares none of it.)

13.2 দুঃখিত (dukkhito) — “sorry,” and a prefix that reaches Greek

Last lesson’s kindness gets a request said politely. This lesson is what you say when the kindness came too late.

You’ll want to know: দুঃখিত

দুঃখিত — *dukkhito* — **sorry**

আমি দুঃখিত (*āmi dukkhito*) — I’m sorry.

The letters in this word

দুঃখিত is দ (*dô*) with the vowel sign ু (*u*), then ঃ — a new mark, the **visarga**, two small stacked dots that add a light breath after the vowel — then খ (*kh*) with the vowel sign ি (*i*), then ত (*t*, silent at the end). Spelled *duḥkhita*, said *dukkhito*: the breath mark softens toward the consonant that follows it rather than staying a separate sound.

The word, taken apart — its roots and family

দুঃখিত is built on Sanskrit দুঃখ (*duḥkha*), “sorrow, suffering” — the word Buddhism made famous as *dukkha*. Take it apart and one half is certain: দুঃ/দুস্ (*dus-*) means “bad, difficult,” from PIE ***dus-**, the very prefix inside Greek **dys-**: **dystopia**, **dysfunctional**. The other half, খ (*kha*), is where the certainty ends. Sanskrit’s own grammatical tradition explains it as “an axle-hole” — a *duḥkha* journey is a **bad axle-hole**, a rough ride, set against সুখ (*sukha*), “a good axle-hole,”

comfort. It is a vivid story, and it is repeated everywhere. It is also, by the account of modern Sanskritists including Mayrhofer, not a story to trust: the axle-hole reading may be a later folk explanation grafted onto a word whose real root is lost. दुः's cousin is real; थ's is a story, reported and not settled.

Your turn

Say these aloud:

- “dukkhito” — sorry
- “āmi dukkhito” — I’m sorry
- the secure half and its Greek cousin — “dus- ... dystopia”
- last lesson’s request again — “doya kore bôshun”

Before you move on

Say “I’m sorry” in Bengali. (আমি দুঃখিত.) Which half of দুঃখ is a secure PIE prefix, and which English word shares it? (दुः/dus-, “bad” — **dystopia**, by way of Greek *dys*-.) Is the “bad axle-hole” story of थ settled fact? (**No** — a repeated tradition, treated with real skepticism by modern Sanskritists.) Sorrow, like compassion, can weigh somewhere specific — where? (हृदय, the heart.)

13.3 माफ करबेन (maf korben) — “excuse me,” borrowed and softened

Last lesson’s word for “sorry” was a native Sanskrit word. This one is a loanword — the very same loanword Hindi uses in its own “sorry” phrase — and it softens a request in a way you have not met yet.

You’ll want to know: माफ करबेन

माफ करबेन — *maf korben* — **excuse me**

माफ करबेन, एकट्ठु जायगा देबेन? (*maf korben, êktu jāyga debên?*) — excuse me, could you make a little room?

The letters in this word

মাফ is ম (*mô*) with া (*ā*) plus ফ (*ph*, the puffed *p*). Notice what is missing: Hindi marks this same borrowed sound with a small dot under its own letter for *pha*, a *nuqtā*, to write a dedicated letter for *f*. Bengali’s script has no such mark at all — ফ alone serves for both the native puffed *p* and this borrowed *f*, and only habit tells a reader which one a given word means.

The word, taken apart — its roots and family

মাফ is not Bengali, and not Sanskrit: it is borrowed, by way of Persian, from Arabic *’afw*, “to pardon, to wipe a wrong away.” Hindi borrowed the identical word for the identical job. Bengali also keeps a formal, Sanskritic cousin for the same idea, ক্ষমা করবেন, from ক্ষমা (*kṣamā*), “patience, forbearance” — the everyday loan and the bookish native word side by side, the same split Hindi keeps.

Grammar Lens: the future, asked to be gentle

The tea-offering pattern you already own reuses a **present** verb — আপনি খান — to make a request. করবেন does the same job with a different tense: it is the plain **future**, “you will do,” not a command at all by its grammar, and yet its job here is exactly a request — a third shape for করা, beside last lesson’s participle করে.

tense used	what it does	example
present habitual	states, and doubles as a request	আপনি খান — you eat / please eat
future	states, and doubles as a <i>softer</i> request	মাফ করবেন — you will excuse / please excuse

The future’s distance is what buys the softness: asking rather than telling, even grammatically.

Your turn

Say these aloud:

- “maf korben” — excuse me
- the two soft requests compared — “chā khān ... maf korben”

Before you move on

Where does মাফ come from? (**Arabic** 'afw, “to pardon,” by **way of Persian** — the same loan Hindi’s own “sorry” phrase uses.) What tense is করবেন, and why does that make it gentler than a command? (**Future** — “you will do,” asking rather than telling.)

13.4 স্বাগতম (shbagotom) — “welcome,” a good arrival

This chapter has taught what to say after a mistake. It closes on what to say before anything goes wrong at all — a word built on the same “hither” you have carried since the verb for **coming**.

You’ll want to know: স্বাগতম

স্বাগতম — *shbagotom* — **welcome**

আমাদের বাড়িতে স্বাগতম (*āmāder bārite shbagotom*) — welcome to our house.

The letters in this word

স্বাগতম is স্ব (a conjunct, স joined straight to ব with no vowel between — *sbô*, tilted by the same *s*→*sh* habit every Sanskrit word in this book has shown) plus া (*ā*), then গ (*gô*), ত (*tô*), and ম (*mô*, keeping its own inherent vowel at the very end): *shbā-go-to-m*.

The word, taken apart — its roots and family

স্বাগতম is Sanskrit স্বাগতম (*svāgatam*), built from two pieces fused together. The second piece, আগত (*āgata*), “arrived, come,” opens with the very same আ-, “hither,” that আসা’s own lesson already named — except here it rides a different verb, √গম্ (*√gam*, “to go, to come”), not আসা’s own unsettled stem. √**gam** is PIE ***g^wem-**, and this root is about as secure as roots get: it is the direct ancestor of English **come**, and, by way of Latin **venīre**, of **advent** and **convene** too. The first piece, সু- (*su-*, “good”), loses its vowel to the glide ব when the next syllable also opens with a vowel — ordinary Sanskrit sandhi, the same trade সু- plus আগত makes every time: *svāgata*. সু- is PIE ***h₁su-**,

cousin of Greek **eu-**, the “good” inside **eulogy** and **euphoria**. Put the pieces back together: স্বাগতম is, literally, “a good coming.”

Your turn

Say these aloud:

- “shbagotom” — welcome
- “āmāder bāṛite shbagotom” — welcome to our house
- the shared prefix — “ā-, hither” — on āsā, then on āgata
- the two secure cousins — “gam ... come” and “su- ... eu-”

Before you move on

Give “welcome” in Bengali. (স্বাগতম.) What does স্বাগতম mean, piece by piece? (“**Good**” plus “**come**” — a good arrival.) Which prefix does it share with আসা, and on a different verb this time? (আ-, “**hither**” — on √gam here, not আসা’s own uncertain stem.) Run this chapter’s three other new words back: a kindness done, a word for sorrow, and a borrowed pardon. (দয়া করে, দুঃখিত, মাপ করবেন.) One more reach: what tense softened that pardon into a request? (**Future** — করবেন, “you will do.”)

Chapter 14

Five Colors

Modes: 👁 eyes (5) ⇌ Hands-free start: all 5 lessons.

By the end of this chapter: I can name five colors in Bengali and say which came from Persian, which from Sanskrit, and which is the one color where Bengali and Hindi genuinely parted ways.

The chapter closes on সবুজ, 'green', a second Persian loan (sabz, the same root behind Hindi and Urdu's sabzī, 'vegetable') that sets beside লাল's own Persian gem-name. The reader names all five colors — lāl, nīl, kālo, shādā, shôbuḡ — and sorts them by origin: two Persian loans, two Sanskrit words, and one worn down by sound change, a more even split between inherited and borrowed than food or family showed.

14.1 লাল (lal) — “red,” a gemstone’s name first

A new small set of words: not people, not verbs, not places, but the colors of the things around you — starting with the one Bengali did not invent for itself.

You’ll want to know: লাল

লাল — lāl — red

লাল চা (lāl chā) — “red tea,” the everyday way to ask for tea without milk.

The letters in this word

লাল is ল (lô) with the vowel sign া (ā), plus a second ল (l, silent at the end): *lāl*, one long vowel between two of the same consonant.

The word, taken apart — its roots and family

লাল is a Persian loan, from Persian *la' l*, which named one specific thing first: a deep-red gemstone, a ruby or a spinel. Only later did the gem's name widen into the ordinary word for the color itself. Bengali did not build this word out of its own materials, and it did not borrow it alone — Hindi's own word for red is this identical Persian loan, carried into both languages by the same jewelers' trade routes rather than independently invented twice.

Your turn

Say these aloud:

- “lāl” — red
- “lāl chā” — tea without milk
- what it named first — “a ruby, not a color”

Before you move on

What did লাল originally name, before it meant “red”? (**A deep red gemstone.**) Did Bengali and Hindi each invent this word separately? (**No** — both borrowed the identical Persian loan.) One more reach: give the polite excuse-me again, and its softening tense. (মাফ করবেন — **the future**, “you will do.”)

14.2 নীল (nil) — “blue,” and a word that only looks like “indigo”

The last color was foreign, borrowed whole. This one is Sanskrit's own — and it comes with a famous false friend worth clearing up honestly.

You'll want to know: नील

नील — *nīl* — blue

नील जल (*nīl jôl*) — blue water.

The letters in this word

नील is न (*nô*) with the vowel sign ी (a long *ī*, the same sound as the short *i* but held longer), plus ल (*l*, silent at the end): *nīl*.

The word, taken apart — its roots and family

नील is Sanskrit नील (*nīla*), “dark blue” — also the name of the **indigo plant** and the dye made from it, the same root Hindi's own *nīlā* carries. One difference is worth stating plainly: Hindi's *nīlā* changes shape, *nīlā/nīlī*, for the noun it describes; **नील never does**, one form whether the water, the sky, or the dress is blue.

Here is the honest, careful version of a famous connection. English “**indigo**” does **not** come from *nīla* by sound change. It comes from **Greek** *indikón*, simply “the Indian [thing]” — because Greek and Roman traders imported the dye *from* India and named it for its source. *Nīla* and “indigo” are not the same word wearing two disguises; they are two **separate** words for the same dye, linked by the history of trade, not by descent from a shared root.

Your turn

Say these aloud:

- “*nīl*” — blue
- “*nīl jôl*” — blue water
- one form, always — “*nīl*,” never *nīlā* or *nīlī*

Before you move on

Does नील change shape for the noun it describes, the way Hindi's *nīlā* does? (**No** — one form, always.) Does English “indigo” come directly from नील/*nīla*? (**No** — it is Greek *indikón*, “the Indian thing”; the two words are linked by trade, not by sound change.)

Give “welcome” once more. (स्वागतम्.)

14.3 कालो (kalo) — “black,” the same word as “time”

Blue carried a false friend. This color hides something bigger inside it: the very word Sanskrit uses for time itself, and for death.

You’ll want to know: कालो

कालो — *kālo* — black

कालो चा (*kālo chā*) — black tea.

The letters in this word

कालो is क (*kô*) with the vowel sign ा (*ā*), plus ल (*l*) with the vowel sign ो (*o*): *kā-lo*.

The word, taken apart — its roots and family

कालो is built on Sanskrit काल (*kāla*), a word that covers both “**black, dark**” and “**time.**” Sanskrit’s own tradition ties the two together poetically — time devours everything, and that devouring is imagined as dark — and the same word names the fierce goddess **Kālī** (“the black/dark one”) and stands as an epithet of **Yama**, the god of death. Hindi’s own *kālā* carries the identical root and the identical story. Be honest, though: whether “black” and “time” are truly **one and the same root**, or two separate ancient words that poetry and theology later **fused** into a single idea, is a real, still-debated question among linguists — the cultural connection is certain; the precise etymology underneath it is not.

Your turn

Say these aloud:

- “*kālo*” — black

- “kālo chā” — black tea
- what else কাল means — “time,” and by extension, death

Before you move on

What does কালো’s root, কাল, also mean, besides “black”? (**Time** — and by extension, death; the same word names the goddess Kālī and Yama’s epithet Kāla.) Is it settled that “black” and “time” are the same root? (**No** — the cultural link is real and ancient, but linguists still debate whether it is one true root or two words later fused.)

14.4 সাদা (shada) — “white,” the color where the cousins part ways

Every color so far has matched Hindi’s, word for word. This one does not — and it is the more interesting choice for it.

You’ll want to know: সাদা

সাদা — *shādā* — **white**

সাদা দুধ (*shādā dudh*) — white milk.

The letters in this word

সাদা is স (*sô*, carrying its familiar tilt to *sh*) with the vowel sign া (*ā*), plus দ (*dô*) with the vowel sign া (*ā*) again: *shā-dā*.

The word, taken apart — its roots and family

সাদা is usually traced to Sanskrit श्वेत (*śveta*), “white,” worn down through Middle Bengali into today’s everyday word — a **tadbhava**, the same road মুখ’s own twin travelled, only in reverse: here the tadbhava is the common word and the **tatsama**, শ্বেত (*śveto*), survives kept whole inside compounds, like শ্বেতাঙ্গ (*śvetāngo*), “pale-skinned.” This is the one color where Bengali and Hindi genuinely part ways. Every other color word met so far — the borrowed gem-name, the indigo plant, the time-word — Bengali and Hindi share outright. For white, Hindi replaced its own Sanskrit-derived word with a **Persian** loan, *safed*. Bengali did not: it kept the native word as its everyday

one, and the Persian loan never took hold here the way it did next door.

Your turn

Say these aloud:

- “shādā” — white
- “shādā dudh” — white milk
- the compound cousin — “śveto ... śvetāngo”

Before you move on

Is সাদা a tatsama, kept whole, or a tadbhava, worn down by sound change? (**A tadbhava** — its tatsama twin, শ্বেত, survives only in compounds, the same split মুখ’s own twin showed.) Of the colors met so far, which one did Hindi replace with a Persian loan while Bengali kept the native word? (**White** — Hindi’s *safed* against Bengali’s সাদা.)

14.5 সবুজ (shobuj) — “green,” and five colors, counted up

One color left, and it is a second loan from the same language that gave লাল its gem — but this time the loan travelled somewhere you already have a word for.

You’ll want to know: সবুজ

সবুজ — *shôbuj* — **green**

সবুজ চা (*shôbuj chā*) — green tea.

The letters in this word

সবুজ is স (*sô*, tilted to *sh*, keeping its own inherent vowel since nothing joins it) plus ব (*bô*) with the vowel sign ু (*u*), plus জ (*j*, silent at the end): *shô-bu-j*.

The word, taken apart — its roots and family

সবুজ is borrowed from Persian **sabz**, “green” — the very same Persian word that gave Hindi and Urdu their word for “vegetable,” **sabzī**, literally “the green things.” লাল’s own Persian gem-name arrived by the same route, from the same trading world, into a different corner of the vocabulary.

Step back and count the five colors this small set has taught: two Persian loans (লাল, সবুজ), two Sanskrit words kept recognizably close to their root (নীল, কালো), and one worn down by sound change (সাদা). A more even split between inherited and borrowed than the food words or the family words showed — color, it turns out, came into Bengali from everywhere at once.

Your turn

Say these aloud:

- “shôbuj” — green
- “shôbuj chā” — green tea
- all five colors — “lāl, nīl, kālō, shādā, shôbuj”
- the two Persian loans, then the two Sanskrit words, then the one worn down — “lāl, shôbuj ... nīl, kālō ... shādā”

Before you move on

What Persian word gives both সবুজ and Hindi’s word for “vegetable”? (**sabz**, “**green**” — Hindi’s *sabzī* is literally “the green things.”) Of the five colors, how many are Persian loans, how many are Sanskrit words, and how many are worn down by sound change? (**Two, two, and one** — লাল and সবুজ; নীল and কালো; সাদা.) Name all five colors, in order. (লাল, নীল, কালো, সাদা, সবুজ.)

Chapter 15

Cloth, Shirt, Sari, and Glasses

Modes: 👁 eyes (4) ⇌ Hands-free start: all 4 lessons.

By the end of this chapter: I can name cloth, a shirt, a sari and glasses in Bengali, and say which word English borrowed directly and which is built on the same Persian word already met for 'eye'.

The chapter closes on চশমা, 'glasses', built on Persian chashm, 'eye' — the very word চোখ's own lesson once named as its only cousin outside the family, here turned into 'eye-thing'. The reader names all four garments — kāpor, jāmā, shāri, chōshmā — states that শাড়ি reached English as a direct modern loanword rather than through a shared ancient root, and reaches back to rescue the dative construction and ভালোবাসা, unrevisited since they were taught.

15.1 কাপড় (kapor) — “cloth,” a word five languages share

Five colors named. Now the things they color, starting with the plainest word for cloth itself — and a sound you have not needed since the verb for reading.

You'll want to know: কাপড়

কাপড় — kāpor — cloth, clothing

সাদা কাপড় (shādā kapor) — white cloth.

The letters in this word

কাপড় is ক (*kô*) with the vowel sign া (*ā*), plus প (*pô*), plus ড — the flapped letter, the same curled-tongue sound the reading verb needed, silent-final here: *kā-po-r*.

The word, taken apart — its roots and family

কাপড় traces to Sanskrit कर्पाट (*karpāṭa*), “rag, old cloth.” Here the honesty runs deeper than usual: even Sanskrit’s own dictionaries label *karpāṭa* a **deśī** word — homegrown vernacular vocabulary that was already sitting inside classical Sanskrit rather than inherited from any older reconstructed root. No further ancestor is claimed for it at all. What makes it worth teaching anyway is how far it travelled sideways: the identical word, worn down by the same kind of sound change, gives Hindi *kapṛā*, Marathi *kaṇḍā*, Gujarati *kaṇḍū*, and Punjabi *kapṛā* — five Indo-Aryan languages sharing one root together, none of them borrowing from the others.

Your turn

Say these aloud:

- “kāpoṛ” — cloth
- “shādā kāpoṛ” — white cloth
- the flap, again — “poṛā ... kāpoṛ”
- the family sharing this root — “kāpoṛ ... kapṛā ... kaṇḍā”

Before you move on

Does কাপড়’s root, *karpāṭa*, trace back to a reconstructed PIE ancestor? (**No** — Sanskrit’s own dictionaries call it a homegrown, *deśī* word.) Name two other Indo-Aryan languages that share this exact root. (**Hindi’s** *kapṛā*, **Marathi’s** *kaṇḍā* — or Gujarati’s *kaṇḍū*, or Punjabi’s *kapṛā*.)

15.2 জামা (jama) — “shirt,” a third word from Persian

Cloth in general, now a specific garment — and Persian, again, supplies the word.

You’ll want to know: জামা

জামা — *jāmā* — shirt

লাল জামা (*lāl jāmā*) — a red shirt.

The letters in this word

জামা is জ (*jô*) with the vowel sign া (*ā*), plus ম (*mô*) with the vowel sign া (*ā*) again: *jā-mā*.

The word, taken apart — its roots and family

জামা is a Persian loan, *jāma*, “robe, garment” — carried into Hindi and Urdu as the identical word, *jāmā*. Count it up: of the clothing and color words in this small set, three now trace to Persian rather than Sanskrit — লাল, সবুজ, and জামা. Bengali’s everyday wardrobe vocabulary leans on the same trading world its colors did.

Your turn

Say these aloud:

- “*jāmā*” — shirt
- “*lāl jāmā*” — a red shirt
- the three Persian loans so far — “*lāl ... shôbuj ... jāmā*”

Before you move on

Where does জামা come from? (**Persian *jāma*, “robe, garment,”** the identical word Hindi and Urdu also use.) How many of this set’s clothing and color words now trace to Persian? (**Three** — লাল, সবুজ, জামা.)

15.3 শাড়ি (shari) — “sari,” a word English simply borrowed

Every English cousin this book has traced so far has been buried deep — a shared PIE root, worn down over thousands of years past recognizing. This word’s road into English was much shorter.

You’ll want to know: শাড়ি

শাড়ি — *shāri* — sari

লাল শাড়ি (*lāl shāri*) — a red sari.

The letters in this word

শাড়ি opens with শ — a second letter for an *s*-family sound, a different one from স. Sanskrit distinguished three of these (স, শ, and a third, ষ); modern Bengali speech has merged them into one sound, but the spelling keeps them apart. Then া (*ā*), ড় (the flap you now know from কাপড়), and ি (*i*): *shā-ri*.

The word, taken apart — its roots and family

শাড়ি traces to Sanskrit शाटी (*śātī*), “a strip of cloth, a garment,” worn down through Middle Indic साडी (*sādī*) into Bengali and Hindi’s shared *śāri/sāri*. Here is the unusual part: every English cousin this book has traced so far — heart, nose, bind, come — went underground for thousands of years, worn down by sound change on both ends until only a shared ancient root connects them. This word took a different road. It entered English directly, in the modern era, as an ordinary borrowed word: “**sari**.” No PIE root, no centuries of drift — just a garment’s name, carried whole into another language’s dictionary.

Your turn

Say these aloud:

- “shāri” — sari
- “lāl shāri” — a red sari
- the second *s*-letter — “শ, beside স”

- three garments so far — “kāpoṛ ... jāmā ... shāri”

Before you move on

How did শাড়ি reach English — through a shared ancient root, worn down over millennia, or as a direct modern loanword? (**A direct loanword** — “sari,” borrowed whole, no PIE root involved.) How many distinct *s*-family letters did Sanskrit distinguish, now merged in Bengali speech? (**Three** — স, শ, ষ.)

15.4 চশমা (choshma) — “glasses,” built on an old cousin’s name

Three garments named. This one closes the chapter by returning to the very body part the eye lesson once traced to a single named Persian cousin — and building something new out of it.

You’ll want to know: চশমা

চশমা — *chôshmā* — glasses

আমার চশমা (*āmār chôshmā*) — my glasses.

The letters in this word

চশমা is spelled চ (*chô*) + শ (*shô*, the second *s*-letter শাড়ি just introduced) + ম (*mô*) + া (*ā*) — four sounds by the spelling. Ordinary speech thins it to three: *chôsh-mā*, not *chô-sho-mā* — an everyday shortening this particular loanword has settled into.

The word, taken apart — its roots and family

চশমা is built on Persian চশম (*chashm*), “eye” — the exact word the eye lesson once named as চোখ’s only named cousin outside the Indo-Aryan family, with no secure English descendant claimed for চোখ itself. চশমা takes that word and adds a suffix that turns “eye” into “eye-thing”: **spectacles**, the thing that sits in front of your eyes. Bengali did not build this the way it built জিজ্ঞাসা করা or সাহায্য করা, by hanging করা on a noun; it took a ready-made South Asian coinage on a Persian root, the same formation Hindi and Urdu also use.

Your turn

Say these aloud:

- “chôshmā” — glasses
- “āmār chôshmā” — my glasses
- the eye it is built on — “chashm ... chôshmā”
- all four garments of this chapter — “kāpor, jāmā, shārī, chôshmā”

Before you move on

What Persian word is চশমা built on, and where did this book meet it before? (**Chashm**, “eye” — named as চোখ’s only cousin outside the family.) Say all five colors and all four garments this small set has now taught. (লাল, নীল, কালো, সাদা, সবুজ; কাপড়, জামা, শাড়ি, চশমা.) Two reaches further back, to close out: who is the subject of *āmār bhālo lāge*, “I like it”? (**Not you** — the good is, the same shape as *āmār chôshmā*, “to me, glasses.”) And is *āmi bhālobāsi*, “I love,” built the same inverted way? (**No** — loving takes you as subject; liking happens to you.)

The Bengali script — a reference

Not to be read before the lessons — they teach reading through real words. This page gathers the system.

The three facts

1. **Consonants carry a built-in vowel — and it is ô, not “a.”** ক kô, ন nô, ম mô — written left to right under a connecting top line, like Devanagari but with rounder shapes. This single fact ($a \rightarrow \hat{o}$) is why Sanskrit words sound “Bengali.”
2. **A vowel sign changes it.** কা kâ, কি ki, কী kī, কু ku, কে ke, কো ko. The *i*-signs ি/ী are written *before* the consonant but read *after* it. A *chandrabindu* ঁ nasalises the vowel.
3. **Standalone vowels have their own letters.** A vowel that *starts* a word is written in full: আ ā, অ ô, ই i, উ u, এ e, ও o.

Worth flagging

- **$s \rightarrow$ “sh.”** The letter স (and শ, ষ) is usually pronounced “sh” — আসি is *āshi*, not *āsi*.
- **No separate *v* or *w*.** Bengali has only ব *b*, so Sanskrit *vāda* $\rightarrow$ *bād*, *Vishnu* $\rightarrow$ *Bishnu*.
- **Conjuncts.** A *hasanta* strips a consonant’s vowel so it fuses with the next: স্ + ক $\rightarrow$ স্ক, চ + ছ $\rightarrow$ চ্ছ. Many conjuncts have special shapes you learn as you meet them.

Bengali in the family

Bengali (*Bānglā*) is **Indo-Aryan** — from Sanskrit, like Hindi, Marathi, and Punjabi — and its script descends, with Devanagari, from the old Brahmi writing of India, which is why they share the hanging top line. It is spoken across West Bengal (India) and Bangladesh, and carries an immense literary tradition — Tagore’s poetry, the anthems of two countries. The lessons trace its Sanskrit roots and, where they reach, the wider Indo-European family that also shaped English.

Glossary

This glossary collects every word and phrase taught in the book. Pronunciation appears when it differs from the written form; chapter numbers show where each entry is introduced.

আসা *āsā*

to come — the verb that never asks whether a man or a woman is speaking
Introduced in Chapter 7.

ভাবা *bhābā*

to think — and the machinery that made a “become” verb into a “think” verb
Introduced in Chapter 8.

ভাই *bhāi*

brother — not borrowed, not a cousin, but the same word as English “brother,”
worn down by six thousand years and two different roads
Introduced in Chapter 11.

ভালো লাগা *bhālo lāgā*

to like — “good sticks to me” — and beside it ভালোবাসা, to love
Introduced in Chapter 9.

ভাত *bhāt*

cooked rice — the meal itself, and a Sanskrit root for “share” that will resurface
two lessons from now in a very different word
Introduced in Chapter 10.

বোঝা *bojhā*

to understand — the third knowing, and the harmony that this time moves the
spelling
Introduced in Chapter 8.

বোন *bon*

sister — not built on the root behind English “sister” at all, but on the very root
that named this book’s rice two lessons ago
Introduced in Chapter 11.

বন্ধু *bôndhu*

friend — a word built openly on “to bind,” and the rare case where Bengali and
English share both the word and the picture behind it
Introduced in Chapter 11.

চা *chā*

tea — a loanword that crossed from China into Bengali overland, and the drink this chapter’s polite offers run on
Introduced in Chapter 10.

চোখ *chokh*

eye — built on the same Sanskrit root as “to see,” worn down through three centuries of Bengali spelling before it looked like this
Introduced in Chapter 12.

চশমা *choshma*

glasses — built on the very Persian word the eye lesson once named as its only cousin
Introduced in Chapter 15.

দয়া করে *doya kore*

please — literally “having done a kindness,” and the noun-plus-করা pattern’s third demonstration
Introduced in Chapter 13.

দুধ *dudh*

milk — a word whose spelling could ask for a trailing vowel but doesn’t, and a root whose one secure English cousin is not the word it looks like
Introduced in Chapter 10.

দুঃখিত *dukkhito*

sorry — built on a word two dictionaries explain two different ways, and a prefix with a real Greek cousin
Introduced in Chapter 13.

দেখা *dækhā*

to see, to look — and the vowel that changes while the spelling stands still
Introduced in Chapter 7.

এক দুই তিন চার পাঁচ *ek dui tin chār pāch*

one to five — and the “two” that kept its Sanskrit vowel
Introduced in Chapter 6.

হওয়া *hōwā*

to be, to become — the second of Bengali’s two be-verbs, and the one that does what আছে cannot
Introduced in Chapter 7.

হৃদয় *hriday*

heart — a word kept whole from Sanskrit, and the oldest, most secure English cousin this book has shown you
Introduced in Chapter 12.

জামা *jama*

shirt — a second Persian loan for clothing, the same word behind Hindi’s own jaamaa
Introduced in Chapter 15.

জানা *jānā*

to know a fact — beside **চেনা**, the second knowing that English merged away
Introduced in Chapter 7.

যাওয়া *jāwā*

to go — and the verb ending that carries how much respect you are paying
Introduced in Chapter 7.

জিজ্ঞাসা করা *jijñāsā kôrā*

to ask — literally “to do a wanting-to-know,” and the door into a thousand verbs
Introduced in Chapter 9.

জল *jôl*

water — the word Chapter 7 already used to say “drink water,” now taught on its own, beside the Bangladesh-register **পানি**
Introduced in Chapter 10.

কালো *kalo*

black — the same word Sanskrit uses for time, and for death
Introduced in Chapter 14.

কাপড় *kapor*

cloth, clothing — a word Sanskrit’s own dictionaries call homegrown, not inherited, and the flapped letter returns
Introduced in Chapter 15.

খাওয়া *khāwā*

to eat — and, in everyday Bengali, to drink as well
Introduced in Chapter 7.

লাল *lal*

red — a jeweler’s word before it was a color word, and the identical Persian loan Hindi already teaches
Introduced in Chapter 14.

লেখা *lekhā*

to write — and the dictionary form that is quietly a noun
Introduced in Chapter 8.

মাফ করবেন *maf korben*

excuse me — the same Persian loan Hindi’s own “sorry” phrase uses, softened here by the future tense rather than a command
Introduced in Chapter 13.

মুখ *mukh*

mouth, face — a word so old that scholars still argue over which language family it belongs to
Introduced in Chapter 12.

নাক *nāk*

nose — the direct cousin of English “nose,” worn down by Bengali’s own sound changes rather than Latin’s or English’s
Introduced in Chapter 12.

নেওয়া *neowā*

to take — and the verb that finishes other verbs
Introduced in Chapter 9.

নীল *nil*

blue — Sanskrit’s word for indigo, one form for every noun it describes
Introduced in Chapter 14.

পড়া *pôṛā*

to read — and the flapped letter Sanskrit never wrote
Introduced in Chapter 8.

পরিবার *pôribār*

family — literally “what surrounds you,” a second word Bengali kept whole from Sanskrit rather than wearing down
Introduced in Chapter 11.

সাহায্য করা *sāhājjo kôrā*

to help — “to go together with,” and the word that finally shows you the inherent vowel
Introduced in Chapter 9.

সাদা *shada*

white — a tadbhava worn down from Sanskrit, and the one color where Bengali and Hindi genuinely parted ways
Introduced in Chapter 14.

শাড়ি *shari*

sari — a Sanskrit word for a strip of cloth that walked, almost unchanged, straight into English
Introduced in Chapter 15.

স্বাগতম *shbagotom*

welcome — “a good coming,” built on the same “hither” prefix already met, and a verb whose PIE root is unusually secure
Introduced in Chapter 13.

সবুজ *shobuj*

green — a second Persian loan, and the chapter’s payoff on all five colors
Introduced in Chapter 14.

আচ্ছা

okay / alright / I see (āchchhā)
Introduced in Chapter 1.

আবার

again
Introduced in Chapter 4.

আবার দেখা হবে

we’ll meet again (goodbye)
Introduced in Chapter 4.

আমি

I

Introduced in Chapter 3.

আমি বাংলা বলি

I speak Bengali

Introduced in Chapter 5.

আমার

my

Introduced in Chapter 2.

আমার নাম ...

my name is... (with no “is”)

Introduced in Chapter 2.

আলাপ করে ভালো লাগলো

pleased to meet you (lit. “having made acquaintance, [it] felt good”)

Introduced in Chapter 2.

আসি

goodbye, lit. “I’ll come [again]” (āshi)

Introduced in Chapter 1.

কি

what

Introduced in Chapter 2.

কাজ করা

to work (lit. “work-do”)

Introduced in Chapter 5.

কোনো ব্যাপার না

it’s no matter / no problem / you’re welcome

Introduced in Chapter 3.

কেমন

how

Introduced in Chapter 3.

কাল দেখা হবে

see you tomorrow (and the কাল puzzle)

Introduced in Chapter 4.

তুমি / আপনি

you (familiar / respectful; also তুই intimate)

Introduced in Chapter 2.

তুমি কেমন আছো?

how are you? (familiar)

Introduced in Chapter 3.

তোমার নাম কি?

what’s your name?

Introduced in Chapter 2.

থাকা

to live, to stay, to remain
Introduced in Chapter 5.

দেখা হবে

(we) will meet (lit. “seeing will happen”)
Introduced in Chapter 4.

ধন্যবাদ

thank you (dhônyobad)
Introduced in Chapter 1.

নাম

name
Introduced in Chapter 2.

নমস্কার

hello / goodbye (nômoshkar)
Introduced in Chapter 1.

বলা

to speak, to say
Introduced in Chapter 5.

ভালো

well, good — and the reply “আমি ভালো আছি”
Introduced in Chapter 3.

হ্যাঁ / না

yes / no (hyã / nã)
Introduced in Chapter 1.

Review Questions

Try these without looking ahead. Every prompt comes from the same canonical lesson data as its chapter. Answers begin in the next section.

Chapter 10

10.1 জল (*jôl*) — “*water,*” *prised out of a phrase you already know*
Type the Bengali word *jôl*, meaning ‘water’.

Answer Key

The first response is the canonical display answer. When a question accepts other authored forms, they appear underneath.

Chapter 10

10.1 জল (*jôl*) — “*water,*” *prised out of a phrase you already know*

Answer: জল

Also accepted: jôl; jol

N

name নাম

explicit focus: script, etymology; Chapter 2, p. 5

nose — the direct cousin of English “nose,” worn down by Bengali’s own sound changes rather than Latin’s or

English’s নাক (nāk)

explicit focus: script, etymology; Chapter 12, p. 65

Numbers One to Five

chapter topic; Chapter 6, p. 19

O

okay / alright / I see (āchchhā) আচ্ছা

explicit focus: script, etymology, usage and culture; Chapter 1, p. 1

one to five — and the “two” that kept its Sanskrit vowel এক দুই
তিন চার পাঁচ (ek dui tin chār pāch)

explicit focus: pronunciation, etymology; Chapter 6, p. 19

P

please — literally “having done a kindness,” and the

noun-plus-করা pattern’s third demonstration দয়া করে (doya kore)

explicit focus: script, grammar, etymology; Chapter 13, p. 71

Please, Sorry, and Welcome

chapter topic; Chapter 13, p. 71

pleased to meet you (lit. “having made acquaintance, [it] felt good”) আলাপ করে ভালো লাগলো

explicit focus: script, etymology; Chapter 2, p. 5

R

red — a jeweler’s word before it was a color word, and the identical Persian loan Hindi already teaches লাল (lal)

explicit focus: script, etymology; Chapter 14, p. 79

S

sari — a Sanskrit word for a strip of cloth that walked, almost unchanged, straight into English শাড়ি (shari)

explicit focus: script, etymology; Chapter 15, p. 87

see you tomorrow (and the কাল puzzle) কাল দেখা হবে

explicit focus: script, etymology; Chapter 4, p. 13

shirt — a second Persian loan for clothing, the same word behind Hindi's own jaamaa জামা (jama)

explicit focus: script, etymology; Chapter 15, p. 87

sister — not built on the root behind English “sister” at all, but on the very root that named this book's rice two lessons ago বোন (bon)

explicit focus: script, etymology; Chapter 11, p. 59

sorry — built on a word two dictionaries explain two different ways, and a prefix with a real Greek cousin দুঃখিত (dukkhito)

explicit focus: script, etymology; Chapter 13, p. 71

T

Taking, Asking, Helping, Liking

chapter topic; Chapter 9, p. 43

tea — a loanword that crossed from China into Bengali overland, and the drink this chapter's polite offers run on চা (chā)

explicit focus: script, grammar, etymology; Chapter 10, p. 51

Tea, Water, Milk, and Rice

chapter topic; Chapter 10, p. 51

thank you (dhônyobad) ধন্যবাদ

explicit focus: script, etymology, usage and culture; Chapter 1, p. 1

The Core Verbs

chapter topic; Chapter 7, p. 23

The First Verbs

chapter topic; Chapter 5, p. 15

The Mind and the Page

chapter topic; Chapter 8, p. 35

to ask — literally “to do a wanting-to-know,” and the door into a thousand verbs জিজ্ঞাসা করা (jijñāsā kôrā)

explicit focus: script, grammar, etymology; Chapter 9, p. 43

to be, to become — the second of Bengali's two be-verbs, and the one that does what আছে cannot হওয়া (hôwā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to come — the verb that never asks whether a man or a woman is speaking আসা (āsā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to eat — and, in everyday Bengali, to drink as well খাওয়া (khāwā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to go — and the verb ending that carries how much respect you are paying যাওয়া (jāwā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to help — “to go together with,” and the word that finally shows you the inherent vowel সাহায্য করা (sāhājjo kôrā)

explicit focus: pronunciation, script, grammar, etymology; Chapter 9, p. 43

to know a fact — beside চেনা, **the second knowing that English merged away** জানা (jānā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to like — “good sticks to me” — and beside it ভালোবাসা, **to love** ভালো লাগা (bhālo lāgā)

explicit focus: script, grammar, etymology; Chapter 9, p. 43

to live, to stay, to remain থাকা

explicit focus: script, grammar, etymology; Chapter 5, p. 15

to read — and the flapped letter Sanskrit never wrote পড়া (pôṛā)

explicit focus: script, grammar, etymology; Chapter 8, p. 35

to see, to look — and the vowel that changes while the spelling stands still দেখা (dækhā)

explicit focus: pronunciation, grammar, etymology; Chapter 7, p. 23

to speak, to say বলা

explicit focus: script, grammar, etymology; Chapter 5, p. 15

to take — and the verb that finishes other verbs নেওয়া (neowā)

explicit focus: script, grammar, etymology; Chapter 9, p. 43

to think — and the machinery that made a “become” verb into a “think” verb ভাবা (bhābā)

explicit focus: script, grammar, etymology; Chapter 8, p. 35

to understand — the third knowing, and the harmony that this time moves the spelling বোঝা (bojhā)

explicit focus: script, grammar, etymology; Chapter 8, p. 35

to work (lit. “work-do”) কাজ করা

explicit focus: script, etymology; Chapter 5, p. 15

to write — and the dictionary form that is quietly a noun লেখা (lekhā)

explicit focus: script, grammar, etymology; Chapter 8, p. 35

W

water — the word Chapter 7 already used to say “drink water,”
now taught on its own, beside the Bangladesh-register

পানি জল (jôl)

explicit focus: script, etymology; Chapter 10, p. 51

we’ll meet again (goodbye) আবার দেখা হবে

explicit focus: etymology; Chapter 4, p. 13

(we) will meet (lit. “seeing will happen”) দেখা হবে

explicit focus: script, grammar, etymology; Chapter 4, p. 13

welcome — “a good coming,” built on the same “hither” prefix
already met, and a verb whose PIE root is unusually

secure স্বাগতম (shbagotom)

explicit focus: script, etymology; Chapter 13, p. 71

well, good — and the reply “আমি ভালো আছি” ভালো

explicit focus: script, etymology; Chapter 3, p. 9

what কি

explicit focus: script, etymology; Chapter 2, p. 5

what’s your name? তোমার নাম কি?

explicit focus: grammar; Chapter 2, p. 5

white — a tadbhava worn down from Sanskrit, and the one color

where Bengali and Hindi genuinely parted ways সাদা (shada)

explicit focus: script, etymology; Chapter 14, p. 79

Y

yes / no (hyā / nā) হ্যাঁ / না

explicit focus: script, etymology, usage and culture; Chapter 1, p. 1

you (familiar / respectful; also তুই intimate) তুমি / আপনি

explicit focus: script, etymology; Chapter 2, p. 5
